The offices of the Department are in the State House, Trenton

STATE OF NEW JERSEY,
DEPARTMENT OF HEALTH,
TRENTON, N. J., Aug. 16, 1934.

To the Senate and General Assembly of the State of New Jersey:

As required by law, I have the honor of submitting herewith the Annual Report of the Department of Health, together with accompanying important documents, for the fiscal year ending June 30, 1934.

CHARLES I. LAFFERTY,
President,
State Department of Health.

STATE OF NEW JERSEY,
DEPARTMENT OF HEALTH,
TRENTON, N. J., Aug. 16, 1934.

To the Department of Health of the State of New Jersey:

GENTLEMEN—I have the honor to submit herewith the Annual Report of the Department for the year ending June 30, 1934. The reports of the Bureau Chiefs will give comprehensive accounts of the activities of the ten Bureaus of the Department during the year.

Respectfully submitted,
J. LYNN MAHAFFEY, M.D.,
Director of Health.

Report of the Director of Health

J. LYNN MAHAFFEY, M. D.

Evidence that the policies of public health agencies have, in general, been sound and that these policies have been carried out with a fair degree of success is found in the health of residents of New Jersey during the last year.

Communicable diseases for which means of prevention and cure have been perfected have decreased steadily in recent years. In 1933, both diphtheria and tuberculosis reached new low case and death rates in New Jersey, smallpox and malaria had practically disappeared and in only one localized outbreak of disease demanding investigation by the Department was there more than 15 cases. Fewer cases of typhoid fever were reported than in any previous year, but the number of deaths from this disease was slightly greater than in 1932, the previous low year.

Infant mortality was reduced 10 per cent. to a new low rate.

The extent to which the downward trend of these causes of illness and death has gone in 10 years is shown in the following table:

N. J. CASE AND DEATH RATES PER 10,000 AND
INFANT MORTALITY RATES PER 1,000

	<i>Diphtheria</i>		<i>Typhoid Fever</i>		<i>Tuberculosis</i>		<i>Infant Mortal- ity Rate</i>
	<i>Case Rate</i>	<i>Death Rate</i>	<i>Case Rate</i>	<i>Death Rate</i>	<i>Case Rate</i>	<i>Death Rate</i>	
1923.....	18.03	1.40	1.83	0.30	16.61	9.01	72
1932.....	3.31	0.23	0.64	0.06	10.72	6.06	50
1933.....	2.39	0.12	0.59	0.09	10.32	5.50	46

DIVERSITY OF WORK

To create a true mental picture of the amount and kinds of work which the Department performed in the last year is not an easy task. Partly, this is due to the great variety of services which are furnished local boards of health, physicians and the public through the 10 bureaus of the State Department of Health, embracing chemical and bacteriological tests, help in dealing with

communicable diseases, including venereal diseases, public health nuisances, water supply and sewage disposal problems, the health and welfare of children, milk, food and drug inspection, registration of vital statistics and the examination and licensing of persons engaged in certain professions and trades.

Partly the difficulty lies in the wide differences in time and skill required in making different types of tests, inspections, surveys, or in solving public health problems. Even when reduced to a quantitative, man-hour basis, the picture lacks the third dimension of the experience and judgment of the personnel involved.

However, some idea of the Department's work may be gained from the total number of certain services rendered. During the year which ended June 30, 1934, employees made nearly 13,000 inspections, met with local health officials or citizens in 4,800 conferences dealing with the public health, investigated 405 cases of communicable disease, gave 570 talks and attended 197 meetings to discuss matters of public health importance. The laboratories examined 107,000 specimens or samples, of which number about 12,500 were collected by members of the Department's staff.

Nurses supervised by the Department made 305,000 home visits, gave advice regarding 56,370 children below school age and 133,830 school children. Reports received, tabulated and filed numbered more than 130,000 for births, marriages and deaths and nearly 93,000 for cases of communicable disease.

NEW SOURCES OF REVENUE

An important change in the method of raising funds for public health work resulted with the adoption by the Legislature of some of the recommendations of the Princeton Survey. By this change, certain license fees which had been nominal in most cases were increased so as to cover part or all of the costs of the necessary inspection service. Thus sums totalling about \$37,000 were made available for the Department's use from license fees for barbers, milk plants and ice cream factories. This amount increased the receipts of the Department by nine per cent. There

may be a difference of opinion as to whether or not such a policy is wise, but the fact remains that in 1933 inspectors could be employed to enforce certain laws only by the aid of this added source of revenue.

COURT DECISIONS

Three opinions of the Court of Chancery strengthened the powers of the Department to insure the safety of public water supplies and adequate treatment of sewage. In one case, the owner of a public, potable water supply was ordered to cease violation of the Potable Water Act; in another a municipality was directed to cease pollution of Raritan Bay with inadequately treated sewage, and in the third, a corporation was restrained from employing an unlicensed operator for its sewage plant.

EMERGENCY RELIEF PERSONNEL

The Department co-operated with the Emergency Relief Administration by giving temporary employment during the winter months to 331 persons. By means of this additional personnel a number of worthwhile projects were carried on, including a child health survey, increased laboratory, office and inspection work and the preparation of useful maps, charts and statistics.

FREE BIOLOGICALS

Free biologicals for the prevention and treatment of communicable disease have not been furnished by the State of New Jersey in the past. During the legislative session of 1934, the Department joined with the Medical Society of New Jersey in asking for an appropriation to supply diphtheria toxoid and smallpox vaccine for use by physicians under certain conditions. Funds equivalent to about \$20,000 a year were granted and the Department authorized to purchase biologicals and distribute them under rules which it should promulgate. The program established near the end of the fiscal year provided, in brief, that the biologicals will be supplied free to any physician who agrees to administer them in accordance with the rules. The rules require him to set apart an hour or period at least twice a month during which he

will give toxoid treatments or smallpox vaccinations for a maximum fee of one dollar each, and without cost in case he feels that the family of the patient cannot afford to pay. He further agrees to report his use of the biologicals to the State Department of Health upon postpaid forms furnished him. The toxoid is for use on children between the ages of six months and ten years only.

The biologicals are being placed in some fifty or more distributing stations located in hospitals, health department offices or drug stores about the State at points convenient to physicians. The object of the program is to secure the protection of more young children against diphtheria and smallpox and to have such preventive treatments given in doctors' offices rather than in public clinics.

IMPORTANT LEGISLATIVE BILLS

Two bills which were introduced in the Legislature but not enacted into law would have been helpful to the Department in safeguarding the health of New Jersey citizens. One provided for the regulation of swimming pools and bathing places. A survey conducted by the Department in the summer of 1933 indicated clearly the need for the supervision of such places. The bill, which preserved local powers of regulation but made use of the technical services of the State, had the approval of health officials generally and of many pool owners. Until some such legislation is adopted, most of the 530 or more fresh water public bathing places in the State will have no official supervision.

The other bill would have enabled the Department to pay small pensions to certain needy typhoid carriers who, by reason of their condition, are unable to support themselves and their dependents. The number of such unfortunates is not great and the sum requested was small. Moreover, the interest and sympathetic attitude of most persons, in and out of the Legislature, who knew of the bill, seemed likely to insure its passage. The investment might, in any year, return many times its principal by preventing needless cases and deaths from typhoid.

DISTRICT SEWAGE DISPOSAL

Creation of the Hackensack River Sewerage District set up an organization to deal with the extensive sewage disposal problem of a large number of small municipalities. The Department recorded its approval of this attempt to eliminate a growing cause of complaint and potential danger to the public health in a comprehensive way.

SEPTIC SORE THROAT

The one large, localized disease outbreak of the year was a milk-borne epidemic of septic sore throat. The milk which spread the infection from cow to man was, of course, distributed and consumed in the raw state. Proof that milk, even when handled with modern equipment and methods and drawn from tested cows, may cause serious disease unless pasteurized, was contained in the 131 cases and 2 deaths recorded in this outbreak.

BARBER LICENSE LAW

During the first year of the law's existence, some 11,300 barbers and apprentices were registered. To attempt to regulate, on a State-wide scale, the work of this large number of persons rendering personal service is likely to give rise to dissatisfaction and to create serious problems unless the barbers themselves cooperate and assist in carrying out the provisions of the law.

SHELLFISH CONTROL

A new bureau, created during the year to handle the problems of sanitation at areas where oysters and clams are grown, stored and shucked, was merged, after a few months' existence, with the long-established Bureau of Food and Drugs. Difficulties arising from a conflict between the demands of sanitation and the practices of an old industry have become acute in recent years and need the wholehearted co-operation of all concerned to effect their solution.

DISTILLERY WASTES

Return of the legally operated distillery has increased the size of such factories making apple brandy until disposal of their wastes has become an acute problem, especially when the plant is located in a rural section with limited sewerage facilities or none at all. Distillery and creamery wastes are among the worst in creating nuisances which demand study and action on the part of the Department.

CROSS CONNECTIONS

Under the provisions of Chapter 13 of the State Sanitary Code, 196 physical connections of the approved type between public potable water supplies and unapproved supplies are now permitted by the State Department of Health. Whether or not this number includes all cross connections in New Jersey is not certain.

Experience in this State and elsewhere has proved how dangerous to the public health a faulty cross connection may be. Pollution of public water supplies by two such connections in the past caused 158 cases and 25 deaths from typhoid fever in New Jersey.

In view of these facts, local health officials and water superintendents cannot be urged too strongly to be sure that no unapproved cross connections exist within their respective jurisdictions.

Report of Bureau of Administration

For the Year Ending June 30, 1934

CHARLES J. MERRELL, CHIEF

The terms of Mrs. Helen M. Berry, Miss Margaret L. MacNaughton and Dr. J. E. H. Guthrie expired as members of this Department on May 1, 1934, and they were reappointed by Governor Moore for terms of four years.

The terms of Mr. Charles I. Lafferty and Dr. Howard E. Winter expired on June 30, 1934. They were reappointed by the Governor for terms of four years, but the Senate has not thus far taken action regarding confirmation of said appointments. The last two named members were, therefore, unable to sit with the Department at the reorganization meeting on July 11, 1934. At this time, Dr. S. A. Cosgrove was elected President and Mrs. Berry Vice-President, for the coming year.

Dr. J. O. McDonald, who served as a member of the Department for nearly nineteen years, passed away on March 30, 1934, and the Governor has thus far failed to appoint anyone in his place.

The following resolutions relative to Dr. McDonald were adopted by the Department on May 1, 1934:

WHEREAS, J. Oliver McDonald, M.D., of Trenton, New Jersey, served as a member of the Department of Health of the State of New Jersey from July 1, 1915, to February 1, 1934, as President of the Board from July 1, 1920, to July 1, 1921, and as Acting Chief of the Bureau of Sanitary Shellfish Control from February 1, 1934, to the date of his death on March 30, 1934; and,

WHEREAS, In this service he brought to the Department a broad experience in his chosen profession of medicine, an intimate knowledge of the varied public health aspects of the work of the Department, particularly in reference to child hygiene, and faithful attention to his responsibilities as a public official; and,

WHEREAS, He exhibited to his confreres on the Board an unflinching courtesy and helpful co-operation in all matters relating to the work of the Department; therefore,

Be It Resolved, That the members of the Board of the State Department of Health feel that the Board and the individual members thereof have sustained a great loss in the death of their associate and desire to express their grief in his passing and their sympathy with his bereaved family; and,

Be It Further Resolved, That these resolutions be spread in full upon the minutes of the Department and a copy of the same sent to Mrs. McDonald and family.

On February 1, 1934, Dr. McDonald was appointed Acting Chief of the new Bureau of Sanitary Shellfish Control, and he continued to serve in this capacity until the time of his death.

Following the death of Dr. McDonald, the Department at its meeting on April 2, 1934, adopted the following resolution:

Resolved:

1. That the Bureau of Sanitary Shellfish Control be constituted a subdivision of the Bureau of Food and Drugs under the direction of the Chief of the latter Bureau;

2. That Mr. Applegate and Captain Parsons be transferred to the Bureau of Food and Drugs and assigned to the subdivision of Sanitary Shellfish Control;

3. That the temporary appointment of Chief of the Bureau of Sanitary Shellfish Control be voided by the death of Dr. J. O. McDonald;

4. That the present committee on Shellfish Control be empowered to assign such other personnel as its discretion indicates from any other Bureau to the subdivision of Sanitary Shellfish Control of the Bureau of Food and Drugs.

Mr. David D. Chandler, member of the Department from July 1, 1920, to July 1, 1932, died on June 30, 1934, and the following resolutions were adopted by the Department on February 6, 1934:

WHEREAS, David D. Chandler, of Newark, New Jersey, served as a member of the Department of Health of the State of New Jersey from July 1, 1920, to July 1, 1932, and as a member of the Board of Examiners of Health Officers and Sanitary Inspectors of the Department for a number of years when the Board was first created and again from March 1, 1932, to the date of his death; and,

WHEREAS, In this service he brought to the Department a broad experience in health administration, an intimate knowledge of the varied public health aspects of the work of the Department, and unusually faithful attention to his responsibilities as a public official, including regular attendance at all stated and special meetings of the Department; and,

WHEREAS, He exhibited at all times to his fellow members in the Department an unflinching courtesy and a most unselfish and helpful co-operation in all matters relating to the work of the Department; therefore,

Be It Resolved, That the members of the Department of Health of the State of New Jersey feel that the Department and the individual members thereof have sustained a great loss in the death of their associate and desire to express their grief in his passing and their sympathy with his bereaved family; and,

Be It Further Resolved, That these resolutions be spread in full upon the minutes of the Department and a copy of the same sent to Mrs. Chandler.

APPROPRIATIONS

An appropriation of \$411,392.52 was granted by the Legislature to the Department for the year ending June 30, 1934. An appropriation of \$420,579 was granted for the year ending June 30, 1935. This is an increase of \$9,186.48 in the regular appropriation from the preceding year. In addition to this, milk plant license fees amounting to \$12,280 will be available for the enforcement of the milk laws, and \$17,600 from barber license fees will be available for the enforcement of the barber law. Fees received from ice cream licenses issued in accordance with the provisions of Chapter 437 of the Laws of 1933 will also be available for the enforcement of the ice cream laws.

At the sessions of the Legislature during the past year, a law was passed, Chapter 127, authorizing the Department to purchase and distribute diphtheria toxoid and/or toxin anti-toxin and smallpox vaccine. The sum of \$10,000 was appropriated for this purpose for the year ending June 30, 1934. A later law, Chapter 240, granting an additional appropriation of \$20,000 for the year ending June 30, 1935, provides that the unexpended balance from the appropriation of \$10,000 granted for the year ending June 30, 1934 shall be made available for the year ending June 30, 1935.

Under a plan of co-operation worked out with the State Medical Society, these biologicals will be furnished free of cost to physicians who agree to set aside a health hour in which they will inoculate and vaccinate young children in accordance with the regulations of the Medical Society and with the rules and regulations adopted by the State Department of Health.

A financial statement showing expenses by Bureaus of this Department for the year ending June 30, 1934, will be found at the close of the Report of this Bureau.

ENLARGED QUARTERS

During the year an additional room has been built in connection with the laboratories of the Department on the fourth floor which will meet a need which has existed for a long time, in furnishing additional facilities for the keeping of rabbits and guinea pigs used in the work of the Bacteriological Laboratory.

The Bureau of Vital Statistics has been provided with vaults in the basement of the State House which are well lighted and ventilated and which will provide ample space in place of the overcrowded, poorly lighted and ventilated vaults used by this Bureau for many years. Additional vault space has also been furnished for other Bureaus of the Department.

The action of the State House Commission in furnishing these additional quarters which have been needed for a long time is much appreciated.

BOARD OF EXAMINERS AND EXAMINATIONS

There were no special examinations conducted by the Board of Examiners of Health Officers and Inspectors during the past year, but the regular examinations were held on the last Friday of July, October, January and April as usual.

On November 14, 1933, Mr. Frank Yates, Assistant Chief of the Bureau of Food and Drugs of the Department, was appointed a member of the Board of Examiners in place of Mr. A. I. Goehrig, who died on April 22, 1933.

James J. Hagen, Jersey City; Patrick J. Monaghan, Newark; Edwin H. Coward, M.D., Pleasantville, together with Wallace T. Eakins and Frank Yates, of the staff of the Department, were reappointed on March 6, 1934, as members of the Board of Examiners for the coming year. The Board reorganized by the election of Mr. Monaghan as President and Mr. Eakins as Secretary for one year.

During the year there were filed with the Department 148 applications for examination as health officer or as inspector of the various classes. Licenses were issued to those receiving a general average of 70% or more as follows: Health Officer, 11; Sanitary Inspector of the First Class, 9; Sanitary Inspector of the Third Class, 4; Plumbing Inspector, 12; Milk Inspector, 4; Veterinary Meat Inspector, 1.

The usual examinations for sewage and water plant operators were conducted by the Bureau of Engineering of the Department during the year. Information in reference to these examinations will be found in the Report of the Bureau of Engineering.

ANIMAL EXPERIMENTATION

An application was received from Hoffman-LaRoche, Inc., of Nutley, New Jersey, for a permit to conduct animal experiments in their research laboratories in Nutley. A special committee of the Department which was appointed to investigate said application submitted report at the meeting of the Department on November 14, 1933, and in accordance with the recommendation of the committee, the following permit was issued on said date:

To all to whom these presents come, greeting:

The Hoffman-LaRoche, Inc., Nutley, N. J., having presented to this Department a petition to carry on within the State of New Jersey, scientific experiments or investigations as provided in Chapter 160 of the Laws of 1915, entitled: "An act for the prevention of cruelty to animals, approved March eleventh, one thousand eight hundred and eighty," wherein it is set forth that it is desired to conduct experiments on animals, including cats and dogs, such experiments to be conducted in the laboratories of Hoffman-LaRoche, Inc., Nutley, New Jersey.

This is to certify that the Department of Health of the State of New Jersey, by virtue of the power conferred upon it by Chapter 160 of the Laws of 1915, aforesaid, hereby authorizes the said Hoffman-LaRoche, Inc., to carry on scientific demonstrations, experiments and investigations, as above indicated in the laboratories of the Hoffman-LaRoche, Inc., at Nutley, in the county of Essex and State of New Jersey.

Dated, Trenton, N. J., this fourteenth day of November, 1933.

A letter was received from Dr. Frederick M. Allen of New York City, making application for a permit to conduct experiments on rats and other small animals on his premises at 167

Upper Mountain Avenue, Montclair, New Jersey. Dr. Allen stated that he had no intention of carrying on experiments on dogs. The following permit granting authorization to Dr. Allen to conduct experiments as requested was issued by the Department on May 1, 1934:

To all to whom these presents come, greeting:

Dr. Frederick M. Allen, of New York City, having presented to this Department a petition for authority to carry on within the State of New Jersey scientific experiments or investigations, as provided in Chapter 160 of the Laws of 1915, entitled "An act to amend an act entitled 'An act for the prevention of cruelty to animals,' approved March eleventh, one thousand eight hundred and eighty," wherein it is set forth that it is desired to establish and conduct laboratories for research work concerning disease and its treatment and scientific problems directly or indirectly connected therewith, such research work and investigation to include animal experimentation on rats and other small animals only.

This is to certify that the Department of Health of the State of New Jersey, by virtue of the power conferred upon it by Chapter 160 of the Laws of 1915, aforesaid, hereby authorizes the said Dr. Frederick M. Allen, of New York City, to carry on scientific experiments and investigations as above indicated, upon the premises known as 167 Upper Mountain Avenue, Montclair, in the county of Essex and State of New Jersey.

Dated: Trenton, New Jersey, this first day of May, 1934.

THE DEPARTMENT OF HEALTH OF
THE STATE OF NEW JERSEY.

By:

CHARLES I. LAFFERTY, *President*,
J. LYNN MAHAFFEY, M.D., *Director*.

CEMETERIES

Application of the Church of the Madonna, Fort Lee, New Jersey, for reversal of the decision of the local officials of Leonia Borough in refusing to grant consent to said church to extend its cemetery in the Borough of Leonia, was submitted to the Department and a public hearing regarding said application was given by a special committee of the Department at Leonia on October 19, 1933. Report was made by the committee at the meeting of the Department on November 14, 1933, and in accordance with the recommendation of the committee, the action of the borough officials of Leonia in refusing to grant consent for the extension

of said cemetery was reversed, and a permit was issued for the extension of the cemetery of said church as requested.

Appeal was made to the Department by the Maplewood Cemetery Company of Freehold for reversal of the decision of the local officials of Freehold Township in refusing to grant consent to said cemetery company to extend its cemetery in said township. A special committee of the Department gave a public hearing regarding said application at Freehold on April 25, 1934. Report was submitted by the committee to the Department at its meeting on May 1, 1934, and the following preamble and resolution was adopted:

WHEREAS, Application has been made to the Department of Health of the State of New Jersey by the Maplewood Cemetery Company of Freehold, New Jersey, for reversal of the decision of the local officials of Freehold Township in refusing to grant consent to said cemetery company to extend its cemetery in said township, and,

WHEREAS, A public hearing was given by a special committee of this Department at Freehold, New Jersey, on April 25, 1934, at which time full opportunity was given to all present to speak for or against the extension of the cemetery and it was shown that the cemetery is owned by local people and the extension is desired to meet local needs, and

WHEREAS, At said hearing the owners of a nearby farm were the only objectors to the extension of the cemetery and no other objections have been received at the office of the Department, and

WHEREAS, Investigation by representatives of this Department shows that there is no objection from a sanitary standpoint to the extension of said cemetery and as there are already two cemeteries located in close proximity to the farm in question it does not appear that the value of the property will be further depreciated by the extension of the Maplewood Cemetery, therefore,

Be It Resolved, That the application of the Maplewood Cemetery Company for reversal of the decision of the township officials of Freehold Township in refusing to grant consent to said cemetery company to extend its cemetery in said township be granted and that the Maplewood Cemetery Company is hereby permitted to extend its cemetery in Freehold Township.

TUBERCULOSIS ASSOCIATION AND HOSPITAL

At a meeting of the Department on November 14, 1933, the Gloucester County Health Association, Inc., was recognized by the Department as a duly constituted health society engaged in the relief and prevention of tuberculosis, in accordance with the provisions of Chapter 65 of the Laws of 1932.

A letter was received from John T. Rowland, architect, making application on behalf of the Board of Chosen Freeholders of Hudson County for approval of the site for the new County Tuberculosis Hospital to be located at Medical Centre in Jersey City. A special committee of the Department gave a hearing concerning said application at the Hudson County Court House, Jersey City, on June 26, 1934, and report will be presented by said committee at the regular meeting of the Department in July.

ANNUAL CONFERENCES

The Twenty-fourth Annual Conference of State and Local Health Officials called by the Director of Health in accordance with provisions of the law, was held on February 16, 1934, in the State House, Trenton.

The Director of Health, J. Lynn Mahaffey, M.D., in calling the conference to order, extended a cordial welcome to representatives of the various local boards of health and their friends gathered at the conference.

The first paper of the afternoon session consisted of "A Summary of the Recent Investigations of Swimming Pools and Bathing Places in New Jersey." This was given by D. M. Dittmars, H. C. Greenfield and L. W. Klockner, Jr., of the Bureau of Engineering of the State Department of Health.

A paper on the subject of "Supervision of Shellfish Sanitation in New Jersey" was read by Edwin G. Applegate, senior chemist of the Department.

LeRoy A. Wilkes, M.D., Executive Secretary of the Medical Society of New Jersey, read a paper on the subject of "Medical Participation in Public Health Activities."

Following the usual roll-call of delegates by counties, a playlet depicting a regular meeting of a local board of health was presented.

The first paper at the evening session, on the subject of "Some Public Health Problems of Recent Development," was read by G. W. McCoy, M.D., Director of the National Institute of Health.

Kendall Emerson, M.D., of the National Tuberculosis Association, spoke on the subject of "The Control of Tuberculosis, with Special Emphasis on the Newer Methods of Case Finding."

The annual meeting of the Health Officers' Association of New Jersey was held in the State House on the following morning, February 17, 1934.

In addition to the usual business session at this annual meeting, the following officers were elected for the coming year: President, Dennis J. Sullivan, Jersey City; vice-president, W. W. Brooke, M.D., Bayonne; secretary-treasurer, William C. Blake, Princeton; members of the Executive Committee: R. C. Errickson, Long Branch; William H. MacDonald, Trenton; Amos Field, Jr., Kearny; Edwin Stewart, M.D., Fair Haven; George N. Golding, Verona; H. R. H. Nicholas, Englewood; A. J. Krog, Plainfield. Mr. Errickson was later chosen chairman of the committee.

On November 24 and 25, 1933, the fifty-ninth annual meeting of the New Jersey Health and Sanitary Association was held at the Hotel Madison, Atlantic City, New Jersey.

The first session, on Friday afternoon, November 24, was devoted to a consideration of papers and addresses on the subject of "Public Works Projects in New Jersey."

Following the President's address in the evening, the session was devoted to the consideration of papers on the "Effects of the Depression on Health and Nutrition."

The papers and discussions at both the afternoon and evening sessions proved to be very interesting.

On Saturday morning, November 25, the usual business session of the association was held, following a paper presented by Dr. George T. Palmer, Director of Research of the American Child Health Association, on the subject of "Increasing the Efficiency of the Health Dollar."

At this session James E. Brooks, C.E., Glen Ridge, was elected president of the association for the coming year.

In accordance with the usual practice, a meeting of the Health Officers' Association of New Jersey was held in the hotel following the final session of the New Jersey Health and Sanitary Association on Saturday morning.

LEGISLATION

The following bills of interest to health officials were introduced at sessions of the Legislature during the past year:

Senate Bill No. 116, requiring dog owners to submit certificates that dogs have been inoculated against rabies before licenses are granted. This bill was withdrawn.

Senate Bill No. 117, making it a misdemeanor for beauty parlors to substitute cosmetics under the names of trade-marked brands. This bill failed to pass.

Senate Bill No. 134, repealing Chapter 427 of the Laws of 1933, making owner liable for dog bites. This bill passed the Legislature, but was vetoed by the Governor and, therefore, did not become a law.

Senate Bill No. 139, creating two Water Supply Authorities, one for North Jersey, the other for South Jersey, empowering said authorities to develop and construct water supplies, to sell water to municipalities, and to issue bonds. This bill failed to pass.

Senate Bill No. 156, creating an Interstate Sanitation Commission of five members to be named by the Governor to act with New York and Connecticut to purify water adjacent to three States. This bill failed to pass.

Senate Bill No. 157, permitting the State to enter into a sanitation treaty with New York and Connecticut. This bill failed to pass.

Senate Bill No. 158, declaring pneumoconiosis, dust disease, compensable under Workmen's Compensation Act. This bill failed to pass.

Senate Bill No. 162, providing for sterilization of epileptics and mental defectives. This bill failed to pass.

Senate Bill No. 167, transferring from local boards of health to the Alcoholic Beverage Control Department supervision duties over liquor and its containers. This bill failed to pass.

Senate Bill No. 168, transferring from the State Board of Health to Alcoholic Beverage Control Division duties regarding liquor. This bill failed to pass.

Senate Bill No. 173, permitting municipalities along the Raritan River to build sewer plants in compliance with court order, regardless of debt limits. This bill became a law, Chapter 202.

Senate Bill No. 183, prohibiting persons not licensed as physicians or surgeons from using the title "doctor." This bill failed to pass.

Senate Bill No. 184, making silicosis, dust disease, compensable under Workmen's Compensation Act. This bill failed to pass.

Senate Bill No. 213, regulating the sale of eggs. This bill became a law, Chapter 146.

Senate Bill No. 219, forbidding the issuing of birth certificates revealing illegitimacy. This bill became a law, Chapter 105.

Senate Bill No. 226, providing procedure for prosecutions under Chapters 169 and 255 of the Laws of 1933, acts covering the sale of milk. This bill became a law, Chapter 132.

Senate Bill No. 227, requiring milk brought into New Jersey to be pasteurized and bottled in this State, and requiring adequate pasturage for cows. This bill failed to pass.

Senate Bill No. 271, including cream cheese in the list of milk products regulated by Chapter 131 of the Laws of 1932 and Chapter 243 of the Laws of 1933. This bill failed to pass.

Senate Bill No. 338, appropriating \$20,000 to the State Department of Health to buy diphtheria serum and smallpox vaccine. This bill became a law, Chapter 240.

Assembly Bill No. 4, providing tuberculosis examinations for prospective public school teachers. This bill failed to pass.

Assembly Bill No. 5, providing physical examinations for teachers in the discretion of boards of education. This bill failed to pass.

Assembly Bill No. 6, providing more thorough physical examinations for school pupils. This bill failed to pass.

Assembly Bill No. 19, allowing peace justices in cities governed by municipal managers to perform marriage ceremonies. This bill failed to pass.

Assembly Bill No. 22, providing licenses for beauty shops and operators. This bill failed to pass.

Assembly Bill No. 28, prohibiting charges by clinics supported wholly or partly by public funds. This bill failed to pass.

Assembly Bill No. 161, requiring license for operation of swimming pools and public baths. This bill failed to pass.

Assembly Bill No. 186, providing that municipal boards of health shall receive all fees from dog licenses where boards grant such licenses instead of sharing the fees with the S. P. C. A. This bill failed to pass.

Assembly Bill No. 202, regulating the making of mattresses, bedding and upholstered furniture, and providing for division of bedding in the State Department of Health. This bill failed to pass.

Assembly Bill No. 213, regulating the embalming and transportation of dead human bodies into New Jersey from outside the State. This bill failed to pass.

Assembly Bill No. 255, appropriating \$5,000 to be expended through the State Department of Health for the care and support of "typhoid carriers." This bill failed to pass.

Assembly Bill No. 279, creating two Water Supply Authorities, one for North Jersey and the other for South Jersey, and empowering the said authorities to develop and construct water supplies, to sell water to municipalities and to issue bonds. This bill failed to pass.

Assembly Bill No. 301, permitting justices of the peace to solemnize marriages. This bill failed to pass.

Assembly Bill No. 373, authorizing the State Department of Health to buy and distribute diphtheria serum and smallpox vaccine, and appropriating \$10,000. This bill became a law, Chapter 127.

Assembly Bill No. 398, regulating sale and distribution of milk in New Jersey or for export from the State. This bill became a law, Chapter 192.

Report of the Bureau of Local Health Administration

For the Year Ending June 30, 1934

WILLIAM H. MACDONALD, CHIEF

Eighty-two thousand four hundred nine cases of the thirty-two diseases declared reportable by Chapter I of the State Sanitary Code were recorded in this Bureau of the Department during the calendar year of 1933. Although this is a greater total than has been reported in recent years, it is gratifying that the diseases of which the larger numbers of cases were reported, were those spread chiefly by contact and for which no specific preventive measure is known or can yet be practically applied on a wide scale.

Measles led the list in number of reported cases and chicken-pox was second in prevalence as indicated by case reports.

Although parents are inclined to look upon measles as a minor disease, this attitude is gradually changing and this change is being reflected in a larger degree of completeness in reporting of cases. Measles in 1933 was charged with causing a greater number of deaths than any of the 32 reportable diseases except tuberculosis, influenza and pneumonia. Sixty-nine per cent. of the 71 recorded deaths from measles were in children less than five years old.

Whooping cough, although less prevalent than in the past two years, caused forty-three deaths, forty-two of which were in children less than five years of age. The fact is significant that both measles and whooping cough take their greatest toll in deaths from babies and young children. Parents should be urged to take care to keep young children from being exposed to these diseases.

Scarlet fever continued about equal in prevalence with recent years; however, in general the cases were relatively mild and the

death rate, 1.36 per 100,000, was next to the lowest annual rate from this disease recorded in New Jersey.

In diphtheria, new low case and death rates were attained. The number of deaths from this cause in 1933 is less than one-tenth the number of deaths from diphtheria in 1913. The decrease in this disease during recent years can be chiefly ascribed to the widespread use of toxin-antitoxin and toxoid as a preventive. To hold the advantage gained and to reduce further this disease, stressing the use of toxoid must continue. The fact that in 1933, over thirty per cent. of the reported cases and seventy per cent. of the recorded deaths from diphtheria were in children below five years of age, point clearly to the need of stressing the use of toxoid among children long before they reach school age. It is in this preschool age period that the greatest good can be accomplished by this preventive measure.

For the third consecutive year poliomyelitis showed a marked increase in prevalence during the summer and early fall months. Of the 234 cases reported, 217 cases were recorded during the months of July, August, September and October. The distribution of the cases in 1933 closely resembled the distribution in 1931, over ninety-five per cent. of the cases occurring in the counties north of Mercer and Ocean.

Tuberculosis also dropped to new low levels in 1933. Not only was the number of new cases reported to the State Department of Health lower than in previous years, but the number of deaths recorded from this cause was also lower than in any year for which records are available. The reduction in deaths was not restricted to one section, but was recorded in practically all counties.

The typhoid fever record for the year is contradictory. The number of cases reported was relatively low (258); however, the number of deaths recorded (42) was greater than in any of the past three years. The indicated fatality rate was 16.27. Two possible causes may be ascribed for such a situation, a series of unusually virulent cases or incomplete reporting of cases. If the latter is the cause, it may be overcome, to a degree at least, by freer use of laboratory facilities now available as an aid in determining the true character of the disease in cases of continued fever.

Rabies in Animals—Reports of 283 cases of rabies in animals were received from 97 local boards of health in eighteen counties. These reports were made in accordance with the provisions of a resolution adopted in April, 1932, by the State Department of Health.

All but two of the animals reported as rabid were dogs.

In annual reports received from local boards of health for the year 1933 it is stated that the number of persons who, to the knowledge of these boards, received Pasteur treatments for the prevention of rabies during the year was 449. The amount of money reported by these boards as having been expended from public funds for these treatments during this period was \$5,528.19.

Chapter 66 of the Laws of 1930 requires that physicians and others report to local boards of health, the names and addresses of persons bitten by dogs, irrespective of whether the animals are suspected to have rabies. While individual reports of all cases of dog bite are not made to the State Department of Health, the total of such cases as given in annual reports from local boards of health for 1933 reached the sum of 8,091.

Investigation of Outbreaks—Field investigation of cases of communicable diseases in an effort to determine the source of infection and to secure facts upon which to base measures to prevent further spread of infection, is a fundamental health department activity. The importance of careful history taking in such cases cannot be over-stressed. Unfortunately in many of the smaller municipalities of the State little or no effort is made to carry out such investigations, nor to record such facts as are collected.

District health officers in the Bureau endeavor to conduct such investigations in certain diseases, and whenever practical do so in company with some representative of the local board of health. Special investigations of this kind are also made by other employees in the Bureau.

During the fiscal year ending June 30, 1934, such detailed field investigations were made by the Bureau of 405 cases in 140 municipalities. These were divided by diseases as follows: Typhoid fever, 137; poliomyelitis, 40; undulant fever, 20; dysentery, 12; septic sore throat, 141; trichinosis, 17, and other diseases, 38.

Typhoid Fever—Investigation of several cases of typhoid fever in Pennsauken Township, Camden County, showed the cases to be among persons who had attended a celebration of the opening of a roadside restaurant in that community on September 21.

Subsequent investigation revealed that cases occurring at about the same time in other communities had also been in attendance. Finally a total of 14 cases in five municipalities was found to have attended this function or to have eaten some of the food served. A platter of food served each guest had on it chicken salad, rolls, pickles and pickled beets. No doubt the infection was transmitted through some of these articles of food, and probably by means of the chicken salad. Repeated examination of discharges from persons found to have taken part in preparing the meal, did not reveal a carrier.

Five cases of typhoid fever, two in New Jersey and three in New York State, were found to have occurred in a group of 24 persons who attended a family dinner party at Teaneck, Bergen County, on September 16.

Turkey salad was the chief article served at the supper. The turkey was prepared for the salad at the home on the day preced-

ing the dinner. One of the persons who assisted in preparing the meat for salad, but who took no part in handling the salad or other food stuffs on the day of the dinner was found to be harboring typhoid bacilli.

Amoebic Dysentery—The discovery of an unusual number of cases of amoebic dysentery in Chicago during the summer and fall of 1933, caused considerable concern in all parts of the country, inasmuch as persons from all sections had visited the city to attend the Chicago World's Fair. It was assumed that some of these visitors doubtless had been exposed to infection in Chicago and would become ill after returning home. This assumption proved correct. In the fall of 1933, cases of amoebic dysentery in this group were recognized in New Jersey. As these cases came to light information about them was secured by employees in the Bureau or by means of special history forms from local boards of health. During the year thirty-one cases of amoebic dysentery were reported, of which twenty-four had visited in Chicago shortly prior to onset. Two others who had not visited Chicago had been in close contact with visitors to that city. Three of the remaining reported cases were considered as cases of long standing with a recurrent attack during the year.

The ages of the patients ranged from eight to sixty-one years. Only two were less than twenty years old. Ten were females, twenty-one were males.

Among the large number of residents of New Jersey who visited Chicago during the summer of 1933, it is most probable others were infected, some of whom likely became ill, without having the true nature of the illness determined.

Undulant Fever—During the calendar year of 1933, twenty-eight cases of undulant fever were reported. Histories were obtained of these cases by employees in the Bureau or by special inquiry of local boards of health.

Judging from the information gathered, two of the patients were probably infected outside New Jersey. Raw milk was used regularly by 17 of the patients apparently infected in the State. Three used both raw and pasteurized milk regularly; three used pasteurized milk regularly. Data on the use of milk by three patients are not complete.

Septic Sore Throat.—The local board of health of Flemington, Hunterdon County, requested aid in January, 1934, in determining whether any common source of infection existed for cases of a severe throat affection with which many residents of the community had recently suffered. Although septic sore throat is not a reportable disease, physicians in the town responded willingly to a personal request for a list of patients recently treated by them for the prevailing disease. Investigation of the cases so reported revealed that although later cases were distributed among users of different milk supplies, the earlier cases in the outbreak had been consumers of milk produced and supplied by one local dealer.

It was concluded that the infection causing the outbreak had been transmitted by this supply and that contact with earlier cases had resulted in a number of secondary cases not among regular users of this milk. The outbreak included 131 listed cases of which two were fatal. Sixty-one of the cases were in males, 70 in females. Fourteen per cent. of the cases were in children less than 10 years of age.

The milk at fault was distributed raw by a producer who took considerable pride in maintaining good equipment and cleanly conditions at his dairy. The examination of cows in the herd for infected udders, however, had been less carefully done and such an examination after the investigation of the cases was under way, revealed that six of the sixteen milking cows each had streptococcus mastitis.

It was also found that a worker on the premises who took part in handling milk was taken ill with sore throat about four days before the first group of cases among users of the milk occurred.

Cows with infected udders were promptly removed from the milking herd and pasteurized milk substituted for raw milk pending the installation of permanent pasteurizing equipment at the dealer's establishment.

Malaria—Nine cases of malaria were reported during the year. From information collected about these cases it is clear that at least seven were infected outside of New Jersey. One of the other cases was probably of long standing. The place of infection of the ninth reported case was not definitely established.

Other Diseases—Several cases of trichinosis were investigated although no wide spread outbreak was discovered.

A case of leprosy was discovered in an Asiatic reported to have been in this country about five years.

One case of tularemia was reported from Bergen County in a person who gave no history of contact with New Jersey rabbits but who gave a history of cleaning the carcass of a rabbit purchased from a local market, but imported from the Middle West.

For the second consecutive year no case of smallpox was reported in the State. This fact, however, does not mean that vaccination is so generally practiced in New Jersey that this disease will not spread should the infection be introduced under conditions favorable for its dissemination.

Communicable Diseases on Dairy Premises—Seventeen cases of scarlet fever, three cases of diphtheria and two cases of typhoid fever were reported on twenty-two premises upon which milk was being produced for sale. In view of preventive measures established, or local action taken, the sale of milk was not prohibited by this Department at any of these premises. In one instance the sale of milk was prohibited by local health officials. In a few instances, although the Department was willing to permit milk to be sold under restrictions agreed to by the dairyman, the firm receiving the milk was unwilling to accept it under any condition while the case was on the premises. This somewhat arbitrary stand has resulted in considerable embarrassment to the producer in some instances, and is not conducive to discovery and prompt notification of cases of these diseases on dairy farms.

As a result of examination of discharges from dairy farm workers, two persons were found to be eliminating paratyphoid "B" organisms. One returned to his home outside of New Jersey. From the second there has since been secured a series of specimens of body discharges and a specimen of gall duct secretion, all of which were found negative from these organisms.

Assistance in Diagnosis—It is the policy to urge that local boards of health, through local personnel, establish a diagnosis when it appears necessary in cases suspected of being communicable diseases and in which a definite diagnosis is in doubt.

In response to special requests, however, diagnostic aid was furnished through this Bureau during the year in 57 instances. The disease suspected in these cases included smallpox, scarlet fever, typhoid fever, measles and others.

Typhoid Carriers—During the year the names of two persons were removed from the list of known carriers of typhoid bacilli; one because of death and one following a series of negative specimens after removal of an infected gall bladder. Four were added to the list of carriers and several persons suspected of being chronic carriers are under observation.

Earning a living is an acute problem with a number of persons so unfortunate as to be carriers of the organisms of typhoid or paratyphoid fever. A considerable proportion of carriers discovered are workers in some business involving the handling of milk or other food for public consumption. As a means to protect the public health they are legally prohibited from continuing in business of this character. To secure gainful occupation in some other line and at a place where their services will be acceptable, is so difficult that some are reduced to actual need. In such extreme cases it seems justifiable that the State should furnish some financial aid for support. A bill to this end was sponsored by the Department and introduced at the last session of the Legislature. Although the bill was not finally acted upon, it was not considered with disfavor in the House of Assembly where it was introduced. There is ample justification for bringing this situation again to the attention of the Legislature.

Free Biologicals—A new State policy was established by the Legislature of 1933-34 in enacting Chapter 127 of the Laws of 1934 entitled, "An act authorizing the State Department of Health to purchase and distribute diphtheria toxoid and toxin-antitoxin and smallpox vaccine and appropriating moneys therefor."

Many states, including several adjacent to New Jersey, have for years followed the policy of supplying some biological products without charge. In this State, however, no preventive biological has previously been furnished free through the State Health Department.

Early in the year the State Medical Society of New Jersey, through its Public Health Committee, advocated a plan to secure immunization particularly of young children. It proposed that if children apply at the office of physicians at special periods selected by the physicians, diphtheria and smallpox immunizations would be given at a maximum charge of one dollar per treatment or without charge if the physician decided the family was unable to pay a fee. This plan further anticipated that health departments would furnish free diphtheria toxoid and smallpox vaccine to such physicians and that the physicians would report the names and other essential information about the children so treated.

The Bureau co-operated in arranging in a number of counties joint meetings of representatives of local boards of health in the county and representatives of the County Medical Society at which the proposal of the physicians could be presented. In the main these meetings and the work following them did not result in the general adoption of the plan. Many boards of health asserted appropriations for their use were so limited they could not furnish materials as requested.

At the meeting of the State Department of Health on January 9, 1934, the President of the State Medical Society outlined the plan and requested that the Department appeal for emergency funds to enable it to supply the necessary biologicals. The Department followed the suggestion. No money for the purpose, however, was set aside from the State emergency funds. Later a bill was passed by the Legislature which became a law on May 2, 1934, and which legally empowered the Department to distribute free, diphtheria and smallpox preventive biologicals under Rules to be adopted by the Department and set aside \$10,000 for carrying the provisions of the act into effect. Subsequently, in June, another law was enacted appropriating an additional \$20,000 to continue the project into the fiscal year beginning July 1, 1934.

At the meeting of the Department on June 5, 1934, Rules for the free distribution of biologicals were adopted as provided in the act. These Rules adopted were in substantial accord with the plan proposed by the State Medical Society and read as follows:

1. The biologicals may be procured without charge by any physician licensed to practice medicine in New Jersey at any distributing station arranged for by

the Director of Health, provided such physician agrees to the following conditions

(a) The physician shall fix an hour or special period to be at least twice in each month at which times he will administer diphtheria immunization treatments to all children between the ages of six months and ten years, who come during such special hours, and will vaccinate against smallpox all who apply for such vaccination during the special hours, at a maximum charge of one dollar per injection or vaccination and without charge in the case of any one who, in the opinion of said physician, is unable to pay for such services.

(b) Notification shall be given the Director of Health of New Jersey of the time and place of such special hours fixed by the physician and of any change in such hours; the stated hours selected, together with the name and address of the physician, and the purpose of such special hours may be made publicly known by the State Department of Health or any local health department or other health agency.

(c) Promptly after completing smallpox vaccination or administering a course of diphtheria immunizing injections with material furnished by the State, the physician shall forward to the State Department of Health, at Trenton, or elsewhere if so requested by the Director of Health, a report on a form furnished by the Department, showing the name, age, sex, color and place of residence of the person treated, together with the date or dates of treatment, the kind of material used and whether the service was performed for a fee or without charge. In the case of smallpox vaccination such report shall also state whether the vaccination was successful.

2. Biologicals furnished any physician shall be for his use upon residents of New Jersey during the special periods selected by him in accordance with Rule 1 (a) and in conformity with the provisions of said Rule.

3. Diphtheria immunizing material and smallpox vaccine furnished shall be kept in a refrigerator in which the temperature shall be between 32° and 50° F.

4. Biologicals furnished shall be utilized with due care to prevent unnecessary wastage.

5. A receipt on a form furnished by the State Department of Health shall be signed and left with the distributing agency at the time any biologicals are obtained.

6. The State Department of Health and any officer or agent thereof, shall not be responsible for any accident nor ill effects which may be ascribed to the use of biologicals furnished.

7. Failure on the part of a physician to comply with any of the Rules set forth above, or proof that a physician is not rendering service to those unable to pay as set forth in Rule 1 (a), or is unjust in determining ability to pay for such services, will be deemed sufficient cause to debar such physician from receiving free biologicals from the State.

Bids for the biologicals were arranged for and received by the State Purchasing Agent, who directed that materials for distribution to counties north of Burlington and Ocean be purchased from

the E. R. Squibb and Sons Company, and that materials be purchased from the National Drug Company for distribution in the southern counties.

The plan adopted for distributing the material involved setting up a limited number of distributing agencies in each county from which any physician could secure the biologicals who agreed to set aside special periods as contemplated in the Rules and to use the materials in accordance with the provisions thereof.

A system for reporting the use of the materials by physicians was also set up and a plan of checking in the Bureau on distribution and use of materials furnished was placed into operation. Original reports from physicians naming children receiving preventive treatments with State biologicals, were to be returned to local boards of health as part of local records.

In establishing distributing stations, first choice was made of offices of local boards of health; then hospitals, other public buildings and private business places were considered in the order named. Nineteen stations in twelve counties had been established and stocked by June 30, 1934.

Eating Establishments—The inspection of eating establishments, particularly in rural districts, was carried out during the year to the limit of the Bureau's facilities. Local boards of health were urged to make such inspections. In areas to which district health officers are assigned, they carried on inspections at roadside eating places, such inspections being made when practical in company with some local health official. Nearly 400 eating places were inspected by employees in the Bureau and reinspection was made at many of these places. Violations of the State Sanitary Code were directed to the attention of local boards of health. Violations of the Sanitary Act and other laws pertaining to the sale and exposure of foods were directed to the attention of the operators of the food stands by the State Department. Several local boards of health made a real effort to secure compliance with the Sanitary Code when violations were drawn to their attention. The response from local boards of health in a number of townships, however, was not effective.

It seems likely, judging from experience in this work during the summer of 1933, that the State Department will have to assume greater responsibility for inspecting roadside refreshment stands in many rural districts if existing fundamental health regulations are to be enforced in such places. The experience of the year has also shown that although in many establishments the equipment is limited, persons in charge are willing and anxious to accept reasonable recommendations for the use of such equipment to the best advantage from the sanitary standpoint. A very large proportion of roadside eating places is closed during the winter. This makes it impractical to carry on inspection of these places except during the summer months.

Summer Camps—Chapter X of the State Sanitary Code provides that any person prior to establishing a camp to be occupied by five or more persons, for three or more days, shall notify the local board of health of the municipality in which the camp is to be located. This chapter also requires that after such notification, a representative of the local health board shall inspect the camp. In the main these regulations have not been effective for the purposes sought and relatively few boards of health in the rural sections make camp inspections.

In areas to which district health officers are assigned at least one inspection each year is made of organized camps of which the Bureau has knowledge. In other sections camp inspections are made by employees in the Bureau when and if it is possible to arrange to do so. In the Bureau files 96 camps are listed. New ones are being established each year. In view of the fact that these places are operated only for a short time each summer, an adequate inspection of all cannot be made by the present Bureau employees without neglecting special work which arises almost daily and which must be considered more in the nature of an emergency.

Special Investigations—Complaints reaching the Department regarding conditions coming within the general classification of nuisances are referred to this Bureau. There also reached the Bureau from citizens and representatives of local health departments many questions regarding private water supplies and private

sewage collection and disposal systems. While investigations cannot be made by the Bureau of all such matters which arise, the number of such investigations made last year by employees in the Bureau, either in company with local health officials or independently, was over 400.

Public Health Course—Rutgers University in co-operation with the Department continued the summer course for health officials during the past summer. Owing to reduced appropriations to the University for summer school purposes, the course was carried on a self-sustaining basis from funds paid by students. Nine students attended the first-year course and two completed the second-year course and received Certificates in Public Health from the University.

Other Work—In addition to activities mentioned, other work performed and services rendered by employees in the Bureau last year included the following:

Number of conferences with local health officials on questions pertaining to public health work	2,648
Number of conferences with other public officials, physicians and citizens on matters related to public health	2,122
Number of meetings of local boards of health attended	35
Number of other meetings relating to health matters attended	162
Number of lectures given in summer course for health officials	53
Number other talks or lectures given and papers read	35
Number of municipalities in which assistance was rendered in giving or reading Schick or Dick tests	21
Number of municipalities in which assistance was rendered in giving toxin-antitoxin or toxoid	8
Number State institutions in which investigation of cases of communicable diseases was made	4
Number of specimens collected from humans, either by employees in the Bureau or with their aid, to be examined for pathogenic bacteria....	904
Number other specimens and samples collected for laboratory examination	186

Report of the Bureau of Engineering

For the Year Ending June 30, 1934

H. P. CROFT, Chief Engineer

In this report there follows a summary of the work accomplished during the past fiscal year. The summary includes:

1. The number of water and sewage projects examined, with engineers' estimates of costs.
2. The number of inspections made during the fiscal year.
3. Samples of water examined from private supplies, with amounts received for such examinations.
4. Samples of water examined from school premises.
5. Waters used on interstate carriers.
6. Federal aid to municipalities.
7. Civil works service employees.
8. Court decisions relative to water supplies, sewage disposal and the licensing of sewage plant operators.
9. Creation of the Hackensack River Sewerage District.
10. Bathing pool legislation.
11. Stream sampling stations.
12. Establishment of factories on watersheds.
13. The disposal of sewage from North Jersey municipalities.
14. Pollutions of the waters of the Raritan River.
15. Chemical precipitation for sewage treatment, with policy and the rules and regulations relating thereto, adopted by the department.

16. Sewage Works Association.
17. Corrected table of physical connections between approved public water supplies and unapproved private water supplies.
18. Issuance of licenses to operate water purification and/or treatment plants and sewage treatment plants.
19. Table upon public potable water supplies.
- Municipal supplies.
 - State institutional supplies.
 - County institutional supplies.
 - Abandoned municipal supplies.
20. Table upon municipal sewage treatment plants.

NUMBER OF WATER AND SEWAGE PROJECTS EXAMINED FROM JULY 1, 1933, TO
JUNE 30, 1934

Character of Projects	Number of Projects	Number of Applying Municipalities, Commissions or Companies	Number of Plans	Engineers' Estimates of Cost
<i>Sewage:</i>				
Trunk, sub-trunk, relief and intercepting sewers, sewer extensions and sewage pumping stations	25	18	101	\$1,030,633.35
Alterations and additions to sewage treatment works	13	12	70	533,750.00
Sewer systems, partial and complete, new	5	5	62	505,780.00

INSPECTIONS

The following inspections have been made during the year:

Water:

Special water inspections, including complaints and conferences	358
Swimming pools and bathing beaches	357

Sewage:

Special sewage and trade waste inspections, including construction work	260
Complaints and conferences	48

One hundred and thirteen certificates were issued to railroad, vessel and airway companies for the use of water upon interstate carriers. Seventy-seven man-working days were spent in the collection of samples from stream sampling stations; twenty-seven man-working days were spent in attending court trials and serving court papers; fifty-three man-working days were spent in attending water and sewage works conventions; eight man-working days were spent in collecting surf samples along the North Jersey coast; seventeen man-working days were spent in inspecting sewage outfalls along the North Jersey coast, and fifty-one man-working days were spent in stream survey work.

The following man-working days were spent in the investigation of water purification and/or treatment plants at:

Delhi, N. Y. (relative to ozone treatment of water)	8
---	---

The following man-working days were spent in the investigation of sewage treatment plants at:

Glassboro	5
Haddon Heights	8
Hammonton	8
Little Falls	29½
Moorestown	7½
Pitman	3
Princeton	15
West Wildwood	6

Sanitary surveys were made on the Assunpink Creek requiring four man-working days; on the Morris Canal, requiring twenty-six man-working days; and on the Rockaway River, requiring six man-working days.

Sanitary inspections were made upon the following streams during the year:

Assunpink Creek	Newton Lake
Caldwell Brook	Park Avenue Lake (Palisades Park)
Delaware River	Pascack Brook
Hackensack River	Passaic River
Hereford Inlet	Rahway River
Lake Parsippany	Rancocas Creek
Lakes Bay	Raritan River
Maurice River	Rockaway River
Metedeconk River	Salt Brook
Millstone River	Shark River
Molly Ann Brook	Shrewsbury River
Morris Canal	

Stream pollutions investigated	107
Notices issued to cease stream pollutions	107
Reinspections of stream pollutions made	118
Cases of stream pollutions found to be abated	13
Cases referred to Attorney General for prosecution	35
Notices issued upon municipalities or sewer companies to cease the discharge of raw or insufficiently treated sewage into waters of the State and/or to alter, add to or improve sewage treatment works	6
Notices issued to corporations to cease the discharge of trade wastes into waters of the State	3
Notices issued to operators of sewage treatment plants to comply with requirements of the department	1
Notices issued upon municipalities and sewer companies to employ licensed operators at sewage treatment plants	1
Notices issued upon municipalities and water companies to improve water supplies	10
Notices issued to distributors of potable water to cease the supplying of water to the public unless source of supply is approved	2
Cases referred to Attorney General for prosecution of municipalities or companies for failure to improve water supplies	6
Cases referred to Attorney General for prosecution of municipalities or companies for failure to cease pollution and to improve sewage treatment works	7
Cases referred to Attorney General for failure of companies to obtain the required permit to locate factories on watersheds	1
Cases referred to Attorney General for failure of municipalities to employ licensed sewage treatment plant operators	1

PRIVATE SUPPLIES

Forty-nine samples of water from private sources of supply have been examined in the laboratory and payment to the amount of \$470 has been made therefor through the Bureau of Engineering, which forwards and interprets the results obtained in the examination of such samples.

A charge of \$15 is made by the department for a complete chemical and bacteriological examination of a sample of water, and a charge of \$5 for a bacteriological examination.

SCHOOL SUPPLIES

Five hundred and twenty-three samples of water have been examined in the laboratory from school water supplies in the State during the year and copies of the results of these examinations have been sent to the local school boards, as well as the State Board of Education, through this bureau, with comments where necessary as to the purity of the supplies.

INTERSTATE CARRIERS

During the fiscal year one hundred and thirteen certificates were issued upon thirty-eight public and five private water supply systems for nine railroad lines, forty-two vessel companies and three airway lines.

FEDERAL AID TO MUNICIPALITIES

The department, through its Bureau of Engineering, circularized the municipalities in the State advising as to the availability of funds, through Federal Aid, for water and sewage work, and setting out in all probability that such funds would not be available after June 1st. It further informed the municipalities that when projects have been held up the department would be glad to co-operate in any way possible in securing such funds. A questionnaire was prepared and mailed to all municipalities in the State owning or operating water and sewage treatment works with reference to the obtaining of funds from the Federal Government for the improvement of or the construction of new works.

CIVIL WORKS

The bureau employed, for a short period, eleven persons to give aid to the unemployed, in a program initiated by the Federal Government through State co-operation. These employees included eight engineers and three clerk stenographers. Work was begun by them upon the watersheds of the State in an endeavor to cleanse these sheds of minor pollutions. The work begun was not carried to completion as the employees were released from service before this could be accomplished.

COURT DECISIONS

During the year important opinions were given by the Court of Chancery in the following cases:

Department of Health *vs.* Harry Read (Owner of a public potable water supply system at Long Valley, New Jersey). Case instituted under the provisions of Chapter 41 of the P. L. of 1899, as supplemented by Chapter 253 of the P. L. of 1909, under an order of the department to improve the quality of the water distributed or sold to consumers for potable purposes. The Final Decree in this cause is:

IN CHANCERY OF NEW JERSEY.

<i>Between</i>	}	On Bill, &c.
STATE OF NEW JERSEY, Ex Rel. Department of Health of the State of New Jersey, <i>Complainant,</i>		
<i>and</i>		
HARRY READ, <i>Defendant.</i>		

FINAL DECREE

This cause coming on to be heard in the presence of Robert Peacock, Esq., appearing for David T. Wilentz, Attorney General, of counsel with complainant, and the pleadings, proofs and exhibits having been read and considered, and the argument of counsel having been heard, and the Chancellor having considered the same, and it appearing that the complainant is entitled to the relief sought and prayed for in its bill of complaint;

It is on this third day of April, A. D. 1934, by his Honor Luther A. Campbell, Chancellor of the State of New Jersey, ordered, adjudged and decreed and the Chancellor doth by virtue of the power and authority in him vested order, adjudge and decree that a writ of injunction of this court do forthwith issue out of and under the seal of this court directed to Harry Read command-

ing the said defendant on and after the fifth day of June, A. D. 1934, to absolutely and immediately desist and refrain from anywise violating the provisions of an act entitled "A supplement to an act entitled 'An act to secure the purity of the public supplies of potable waters in this State,' approved March seventeenth, one thousand eight hundred and ninety-nine," approved April twenty-first, nineteen hundred and nine;

And it is further ordered, adjudged and decreed that the said defendant pay to the complainant its costs in this suit to be taxed.

LUTHER A. CAMPBELL,
C.Respectfully advised,
WM. J. BACKES,

A. M.

A True Copy,
FERD GARRETSON,
Clerk.

Department of Health *vs.* Borough of Keyport. The municipality was ordered by the department to cease the pollution of the waters of the Raritan Bay by discharging improperly, insufficiently and inadequately treated sewage therein from its municipal sewage treatment works and to improve said sewage treatment works in order to abate such pollution. The case was instituted under the provisions of Chapter 72 of the P. L. of 1900, its amendments and supplements. The Final Decree in this case is:

IN CHANCERY OF NEW JERSEY.

<i>Between</i>	}	On Bill, &c.
DEPARTMENT OF HEALTH OF THE STATE OF NEW JERSEY, <i>Complainant,</i>		
<i>and</i>		
BOROUGH OF KEYPORT, <i>Defendant.</i>		

FINAL DECREE

This cause coming on to be heard in the presence of Robert Peacock, Esq., appearing for David T. Wilentz, Attorney General, of counsel with the complainant, and Howard Roberts, Esq., appearing for Messrs. Snyder & Roberts, of counsel with the defendant, and the pleadings, proofs and exhibits having been heard, and the Chancellor having considered the same, and it appearing that the complainant is entitled to the relief sought and prayed for in its bill of complaint;

It is on this thirty-first day of May, A. D. 1934, by his Honor, Luther A. Campbell, Chancellor of the State of New Jersey, ordered, adjudged and decreed and the Chancellor doth, by virtue of the power and authority in him vested, order, adjudge and decree that a writ of injunction of this court do

forthwith issue out of and under the seal of this court directed to the Borough of Keyport commanding the said defendant that on and after the first day of August, nineteen hundred and thirty-four, said Borough of Keyport absolutely cease its unlawful act of polluting the waters of Raritan Bay by discharging therein improperly, inadequately and insufficiently treated sewage from its sewerage system;

And it is further ordered, adjudged and decreed that from and after the said first day of August, A. D. 1934, the Borough of Keyport, its officers, servants, employees and agents absolutely desist and refrain from permitting and allowing improperly, inadequately and insufficiently treated sewage to flow from its sewerage system into the waters of said Raritan Bay, and further commanding said defendant, Borough of Keyport, on or before the first day of August, A. D. 1934, to make such other disposition of its sewage as shall be approved by the Department of Health of the State of New Jersey.

And it is further ordered, adjudged and decreed that the defendant pay to the complainant its costs in this suit, to be taxed.

LUTHER A. CAMPBELL,
Chancellor.

Respectfully advised,
MAJA LEON BERRY,
Vice Chancellor.

A True Copy,
EDW. WHEELAN,
Clerk.

Department of Health vs. Rumson Land and Development Company. This company owns and operates a public sewage treatment works at Rumson, New Jersey, and was ordered by the department, under the provisions of Chapter 23 of the P. L. of 1918, to employ the services of a licensed sewage treatment plant operator to comply with the act. The Final Decree in this case is:

IN CHANCERY OF NEW JERSEY.

<i>Between</i>	}	
THE STATE OF NEW JERSEY, at the Relation of the Department of Health of the State of New Jersey,		
<i>and</i>		
RUMSON LAND AND DEVELOPMENT Co., a corporation of the State of New Jersey,		On Bill, &c.
<i>Defendant.</i>		

FINAL DECREE

This cause coming on to be heard in the presence of Robert Peacock, Esq., appearing for David T. Wilentz, Attorney General, of counsel with complainant, and the pleadings, proofs and exhibits having been read and considered, and

the argument of counsel having been heard, and the Chancellor having considered the same, and it appearing that the complainant is entitled to the relief sought and prayed for in its bill of complaint;

It is on this third day of April, A. D. 1934, by his Honor Luther A. Campbell, Chancellor of the State of New Jersey, ordered, adjudged and decreed and the Chancellor doth by virtue of the power and authority in him vested order, adjudge and decree that a writ of injunction of this court do forthwith issue out of and under the seal of this court directed to the Rumson Land and Development Company, a corporation of the State of New Jersey, commanding the said defendant that on and after the fifteenth day of April, A. D. 1934, said Rumson Land and Development Company, a corporation of the State of New Jersey, its officers, servants, employees and agents, to absolutely and immediately desist and refrain from anywise violating the provisions of an act entitled "An act to provide for the examination and licensing of superintendents and operators in charge of water purification or treatment plants and sewage treatment plants under the direction of the Department of Health of the State of New Jersey," approved February ninth, one thousand nine hundred and eighteen.

And it is further ordered, adjudged and decreed that the said defendant pay to the complainant its costs in this suit to be taxed.

LUTHER A. CAMPBELL,
C.

Respectfully advised,
WM. J. BACKES,
A. M.

FERD GARRETSON,
Clerk.

HACKENSACK RIVER

On September 5, 1933, the Legislature adopted Chapter 373 of the P. L. of 1933, creating the Hackensack River Sewerage District and the Hackensack River Sewerage Authority to manage the district and defining the Authority's powers and duties for the construction and operation of a sewer with ways and means for payment of costs for construction and operation. The district embraces the territory situate and lying within the natural drainage area of the Hackensack River and its tributaries between Newark Bay and the boundary line between the State of New Jersey and the State of New York.

The Authority consists of four members and is constituted a body politic and corporate with perpetual succession under the name of "Hackensack River Sewerage Authority". It is empowered, under the law, to design, finance, construct, acquire and

operate a system of trunk, intercepting and outlet sewers, pumping and ventilating stations, treatment plants or works and/or other plants and structures as in its judgment will provide the most effectual and advantageous plan or method for relieving the Hackensack River and its tributaries from pollution and for preventing pollution of the same.

Before construction of the district sewer system is begun the plans and specifications shall be submitted to the State Department of Health for approval as a sanitary measure and a permit obtained for proceeding with the work. Final payment upon the construction of a treatment plant shall be retained by the Authority until the plant has been completed and the construction shall receive the approval of the State Department of Health as to its condition and prospective sanitary operation.

The Authority shall submit to the State Department of Health a copy of their report for approval of the proposed district sewer system as a sanitary measure.

The following preamble and resolution, with reference to the work of the Hackensack River Sewerage Authority, was adopted by the Department:

WHEREAS, The State Department of Health has for many years been cognizant of unsatisfactory conditions of sewage disposal in many communities draining into the Hackensack River and its tributaries; and,

WHEREAS, Inspections by the representatives of the Department have repeatedly shown such conditions to be detrimental to public health and the condition of various actual or potential sources of potable waters in that territory; and,

WHEREAS, The Department has repeatedly exhausted all legal means at its disposal to obtain correction of the said unsatisfactory situations in this area; and,

WHEREAS, Its efforts have been in many cases unsuccessful by reason of the economic inability of various local municipalities to carry out its requirements; therefore,

Be It Resolved, That the Department of Health of New Jersey indorses the formation of the Hackensack River Sewerage Authority and strongly indorses the effort of that body to obtain the financing necessary to carry out its projects from Federal sources, feeling sure that neither the individual nor combined financial resources of the several communities concerned are adequate for that purpose; and,

Be It Further Resolved, That a copy of this resolution be spread in full upon the minutes of the Department and that other copies be sent to the Hackensack River Sewerage Authority, and to any other person or body which said Authority directs.

Motion was made and carried that the complaints regarding the pollution of the Hackensack River be held in abeyance pending action by the Hackensack River Sewerage Authority.

In a petition of Leonia to release that borough from the requirements of chlorinating the sewage from its north side sewage treatment works until such time as all other communities discharging sewage into Overpeck Creek shall use chlorine at their sewage treatment works, it was resolved by the department that said department is of the opinion that the granting of such permission petitioned for by the borough is a matter that should first have the approval of the Hackensack River Sewerage Commission, and if such permission is granted by that commission then the department will acquiesce with the commission in the allowance of the discontinuance of the chlorination of the sewage effluent discharged into Overpeck Creek, a tributary of the Hackensack River, Leonia being the only borough now treating sewage by chlorination of those municipalities owning and controlling sewage treatment works within the area over which the Hackensack River Sewerage Commission has jurisdiction.

BATHING POOL LEGISLATION AND A SUMMARY OF INVESTIGATIONS

The department renewed its attempt to obtain legislation for the sanitary protection of the bathing public and to provide a uniform design for the construction of pools in New Jersey. A bill similar to the one presented in 1933 was drafted, presented to the Legislature of 1934 and again failed of passage.

Inspections were made at practically all of the pools in the State by the department's representatives and samples of pool water collected for analyses to determine the sanitary quality of the water in the pools.

STREAM SAMPLING STATIONS

The work begun in August, 1932, in collecting samples of water from the various streams in the State, where the department had set up sampling stations, the location of such sampling stations being governed by sewage and trade waste treatment

plants, water supply intakes and existing and proposed recreational centers upon the said streams, has been continued during the year. Collections have been carried out under a routine schedule as formerly, these being so rotated that samples from every collection point are taken under all of the seasonal variations.

The purpose of the work has led, and will lead, to the protection of the public potable water supplies, recreational centers, bathing beaches, protection of fish life and waters used for agricultural irrigation, stock watering and other uses, as well as to the prevention of pollution of the streams.

ESTABLISHMENT OF FACTORIES ON WATERSHEDS

During the year, under the provisions of Chapter 280 of the P. L. of 1921, the following application was approved for the construction of industrial plants upon watersheds in the State:

Oakland (Louis A. Deacon & Company), apple brandy factory, Oakland well field.

In addition to the above, distilleries have been established in several instances without first obtaining a permit, presumably through ignorance of the law.

Distillery wastes, commonly known as "spent cider," are heavily loaded with organic matter and have a very harmful effect on the streams into which they are discharged, unless the amount of diluting water in the stream is many times as great as the volume of wastes discharged. They have a great avidity (demand) for the oxygen dissolved in the water and either use it up to such a degree that fish cannot live in the water or even worse, use the oxygen up completely thereby producing foul odors and completely ruining the stream for other uses, such as water supply for man or beast and recreational purposes.

The treatment of these wastes is a difficult problem to solve. This department is strongly advising their exclusion from small upland streams and disposal by broadcasting them onto the land where conditions are favorable as a temporary measure until an approved method of de-hydrating the wastes has been perfected. Present indications are that by the installation of suitable ap-

paratus the wastes can be put in condition to market economically as a fertilizer base.

The following is a list of distilleries either actually established or proposed:

Distilled Liquors Corporation	Flemington, N. J.
Lord Stirling Distillery	Kings Station, N. J.
Read Applejack Distillery	Blairstown, N. J.
Smith's Distillery	Roxburg, N. J.
Burnt Mills Distillery	Burnt Mills, N. J.
Albert Kellerman & Sons	Hampton, N. J.
Glen Gardner Distilling Corporation	Changewater, N. J.

THE DISPOSAL OF SEWAGE FROM NORTH JERSEY SEASHORE MUNICIPALITIES

For several years past the department has endeavored to improve the sewage treatment works in municipalities along the North Jersey coast, so as to make such water safe for bathing purposes. The majority of the municipalities have complied with the requirements of the department and are protecting their own, as well as adjoining beaches along the Atlantic Ocean. Court proceedings had to be resorted to in several cases to carry out the orders of the department for the improvement of sewage treatment works in a few of the municipalities. Investigations have been made at the North Jersey seashore sewage treatment works, samples of the effluent to be discharged into the ocean collected, sea outfalls tested, surf samples collected at all of the bathing beaches along the coast from Long Branch to Point Pleasant and recommendations made where necessary for the improvement of such sewage treatment works as a sanitary measure of protection for these beaches.

POLLUTIONS OF THE WATERS OF THE RARITAN RIVER

Stipulations of Agreement entered into between the department and municipalities in the Raritan River Valley to abate pollutions of the Raritan River by the discharge therein from municipal sewer lines and plants, of raw and partially treated sewage, through the Court of Chancery, having expired on April 1, 1934,

it was on motion voted that the cases be moved in the courts against the municipalities.

CHEMICAL PRECIPITATION FOR SEWAGE TREATMENT

Instructions were issued in September, 1933, to the Bureau of Engineering to prepare rules and regulations relating to the method of chemical precipitation for sewage treatment.

At a meeting of the department held on April 2, 1934, a policy was adopted upon the Chemical Precipitation Method of Sewage Treatment, which shall be considered as a degree of treatment intermediate between what are commonly known as sedimentation and sedimentation and oxidation.

At a meeting of the department held on April 2, 1934, rules and regulations were adopted for the preparation and submission of designs for sewage treatment works containing chemical precipitation devices, which follow:

POLICY

The method of sewage treatment, chemical precipitation, shall be considered as a degree of treatment intermediate between what are commonly known as sedimentation, and, sedimentation and oxidation.

At sewage treatment works which will discharge their effluents into intra-state waters later used for public potable purposes, the method of chemical precipitation shall be supplemented by methods of oxidation and chlorination; at sewage treatment works which will discharge their effluents into certain areas of interstate and intra-state waters, the method of chemical precipitation shall be supplemented by method (s) of oxidation and/or chlorination.

Sewage treatment works using the method of chemical precipitation, or, using the method of chemical precipitation along with other methods of treatment, shall be approved only when the applicant (owner, and in case of a municipality or other governmental authority, the elective official or authorized body) by formal action advises the Department of Health of the State of New Jersey, that the proposed works will be under skilled technical

supervision at all times and that the works will be adequately manned twenty-four hours per day.

These rules and regulations established on April 3, 1934, for the design of sewage treatment works containing chemical precipitation devices are minimum rules and regulations and are subject to changes and additions.

RULES AND REGULATIONS

The rules and regulations for the preparation and submission of designs for sewer systems and sewage treatment works adopted by the Department of Health of the State of New Jersey on August 11, 1925, (subdivision "d" item 4, page 13, requiring circulation of sludge in separate sludge digestion tanks was waived, January 9, 1934), shall be considered a part of these rules and regulations.

Details of construction not provided for in the rules and regulations of 1925, or hereinafter, will be considered separately.

Bar screens, either mechanically or manually cleaned, shall be provided.

Coagulants, in a liquid condition, shall be applied to the sewage proportionately to its flow.

A chamber or tank for the rapid and thorough mixing of the sewage and coagulant (s) shall be provided. The detention period shall be not less than one minute based on average flow. A means for thorough mixing consisting of power driven paddles, propellers or diffused air shall be provided. A by-pass line that will permit the complete cleaning of the tank shall be provided; this line is to be equipped with a valve that can be sealed in a closed position.

Two or more flocculation tanks providing a combined detention period of not less than twenty (20) minutes shall be provided. Diffused air or paddles shall provide continuous agitation of the full content of the tanks. Independent controls for each tank shall be provided; provision shall also be made for complete cleaning and drainage of each tank.

Sedimentation shall be provided by two or more tanks having a combined detention period of not less than two (2) hours, based on average flow. Mechanical means for sludge removal shall be provided in one-story tanks. Short-circuiting shall be prevented by proper baffling. Independent control of mechanical equipment for each tank shall be provided.

Mechanical strainers or filters as an adjunct to chemical precipitation tanks shall not be considered as a substitute for a method of oxidation referred to in "policy".

- (a) Adequate automatic control of pumps shall be provided.
- (b) An auxiliary source of power for the electrically driven mechanism shall be provided.
- (c) Devices must be installed to give warning of break-down of mechanical equipment.
- (d) The automatic control of apparatus feeding chemicals for precipitation shall include equipment to provide variation in chemical dosage with variation in sewage flow.
- (e) Detailed information, including capacity, construction and operation, upon the proposed equipment shall be submitted.

Where it is desired to manufacture the coagulant, such as ferric chloride, at the plant, the equipment used shall be an entirely separate unit. Facilities shall be provided for the production of a chemical solution of a fixed strength.

The rate of 150,000 gallons per acre per day (Sand Filters, Rules and Regulations of 1925) is increased to 400,000 gallons.

SEWAGE WORKS ASSOCIATION

The New Jersey Sewage Works Association and the Bureau co-operating, held on March 22 and 23, 1934, at Trenton, New Jersey, its annual conference. Papers with information valuable to the engineering profession in the construction and operation of sewage plants were read and discussed before the meeting. About three hundred persons were in attendance, embracing consulting and civil engineers, chemists, representatives from the engineering journals and manufacturers of sewage plant equipment, along with the operators of plants in this and other states.

PHYSICAL CONNECTIONS

The following corrected table contains a list of the physical connections existing between public potable water supplies and unapproved sources of water supply.

PHYSICAL CONNECTIONS BETWEEN APPROVED PUBLIC POTABLE WATER SUPPLIES AND UNAPPROVED PRIVATE WATER SUPPLIES

NAME OF MUNICIPALITY	NAME OF COMPANY	PUBLIC POTABLE WATER SUPPLY	UNAPPROVED WATER SUPPLY	NUMBER AND SIZE OF CONNECTION
Arlington	The Post Viscoloid Co., Inc.	Kenny Water Department (North Jersey District Water Commission)	Drilled wells	1-6"
Avenel	Steel Equipment Corporation	Middlesex Water Commission	Artesian well	2-6"
Bayonne	American Radiator Company	Bayonne Water Department (North Jersey District Water Supply Commission)	Rain water from reservoir	1-4"
Bayonne	The Babcock and Wilcox Co.	Bayonne Water Department (North Jersey District Water Supply Commission)	Salt water system	2-6"

BUREAU OF ENGINEERING

THE ISSUANCE OF LICENSES TO OPERATE WATER PURIFICATION AND/OR TREATMENT PLANTS AND SEWAGE TREATMENT PLANTS

During the year ending June 30, 1934, examinations for licenses to operate water purification and/or treatment plants and sewage treatment plants were conducted on October 26, 1933, and April 20, 1934, in accordance with the provisions of Chapter 23, P. L. of 1918.

The number of applicants for examinations, the number admitted to the examinations, the number of applicants examined and the number of licenses issued for each grade and class to operate sewage treatment plants and water purification and/or treatment plants, respectively, are presented in the following tabulation:

	No. of Applicants	No. of Applicants Accepted	No. of Applicants Examined	No. of Licenses Issued
<i>Sewage</i>				
Grade A.....	17	15	13	9
“ B.....	3	3	3	3
“ C, Division 1.....	4	3	2	0
“ C, Division 2.....	2	2	2	1
“ C, Division 3.....	0	0	0	0
“ D, Division 1.....	10	7	7	3
“ D, Division 2.....	9	7	7	5
“ D, Division 3.....	1	1	1	1
“ E.....	2	2	1	1
“ F.....	6	4	3	0
“ G.....	1	1	1	1
“ S.....	13	12	10	7
Total.....	68	57	50	31
<i>Water:</i>				
First Class.....	9	8	8	6
Second Class.....	1	1	1	0
Third Class.....	4	4	3	2
Fourth Class.....	22	22	20	12
Total.....	36	35	32	20
Combined Total.....	104	92	82	51

Percentage of number of applicants that were accepted for the examinations 88.46%
 Percentage of number of applicants examined that were issued licenses 62.2%

Two "Prior-to" licenses were issued to operate water purification and/or treatment plants in accordance with the provision contained in Section 2 of Chapter 23, P. L. of 1918.

Two permits to operate additional treatment plants under authority of licenses held were issued in accordance with the provisions of Section 11 of the Rules and Regulations governing the issuance of licenses.

The department, through proceedings instituted by the Attorney General, obtained an injunction in the Court of Chancery against a corporation of the State restraining the violation of the licensing act, Chapter 23, P. L. of 1918.

Experience in the administration of the licensing act under the Rules and Regulations which were adopted on July 12, 1932, had shown that certain alternatives and changes in the qualifications required for admission of applicants to the examinations were essential. The definition of "Training" was changed to include "acceptable credit" attained by the applicant instead of completion of the course or mere attendance at a school. The definition of "Experience" was supplemented by "or, equivalent in the opinion of the State Department of Health" because some applicants lacking the required number of years of actual operating experience to be admitted to the examination for the grade or class of license desired offered experience in such closely allied work to augment actual operating experience that their qualifications were unquestionable. The revisions to that section of the Rules and Regulations relating to qualifications required for admission of applicants to the examinations for licenses were adopted by resolution of the New Jersey State Department of Health at a meeting held on March 6, 1934. Said resolution and revisions are as follows:

RESOLUTION

WHEREAS, The Department of Health of the State of New Jersey deems it necessary to make certain changes in the qualifications required for admission of applicants to examinations for licenses to operate water purification and/or treatment plants and sewage treatment plants, as contained in the Rules and Regulations governing the said examinations for licenses, which Rules and Regulations were amended and adopted by the Department of Health on July 12, 1932; therefore,

Be It Resolved, By the Department of Health of the State of New Jersey, at the meeting held on the sixth day of March, A. D., one thousand nine hundred and thirty-four, that the following revisions to the qualifications required for admission of applicants to examinations for licenses to operate water purification and/or treatment plants and sewage treatment plants be and are herewith adopted by the Department of Health of the State of New Jersey:

QUALIFICATIONS REQUIRED FOR ADMISSION OF APPLICANTS TO EXAMINATIONS FOR LICENSES TO OPERATE WATER PURIFICATION AND/OR TREATMENT PLANTS

Definitions:

1. TRAINING shall be interpreted as acceptable credit for an operators' short course or vocational school course, specializing in water purification and/or treatment; or, equivalent in the opinion of the State Department of Health,

2. EXPERIENCE shall be interpreted as the time actually engaged as a licensed operator in charge of a water purification and/or treatment plant or engaged as an assistant at a plant requiring the classification of license desired; or, equivalent in the opinion of the State Department of Health.

QUALIFICATIONS REQUIRED FOR ADMISSION OF APPLICANTS TO EXAMINATIONS FOR LICENSES TO OPERATE SEWAGE TREATMENT PLANTS

Definitions:

1. TRAINING shall be interpreted as acceptable credit for an operators' short course or vocational school course, specializing in sewage treatment; or, equivalent in the opinion of the State Department of Health.

2. EXPERIENCE shall be interpreted as the time actually engaged as a licensed operator in charge of a sewage treatment plant or engaged as an assistant at a plant requiring the classification of license desired; or, equivalent in the opinion of the State Department of Health.

DESCRIPTIVE DATA OF PUBLIC

OWNER AND MUNICIPALITIES SUPPLIED	SOURCE OF SUPPLY	Other Sources Available for Emergency
Allendale (Municipality)	2 driven wells, 450'-500' deep	
Allenhurst (Municipality)	3 driven wells, 350' deep	
Allentown (Municipality)	Indian Run Spring Pond; Tributary to Doctor's Creek	
Asbury Park (Municipality)	3 wells, 1132'-10" casing, 8" strainer	1 repaired well, 1000' deep
(Septune Twp., part)		
Association of Property Owners (Gillette Section of Passaic Twp.)	1 driven well, 410' deep

Atlantic Highlands (Municipality)	2 driven wells, 130'-593' deep	
(Middletown Twp., part)		
Avalon (Municipality)	1 driven well, 925' deep	2 driven wells, 950' deep
Avon (Municipality)	2 driven wells, 510' deep	1 driven well, 1150' deep
Barnegat City (Municipality)	1 driven well, 510' deep	
Barnegat Water Co.	2 driven wells, 150'-152' deep	
(Barnegat Section of Union Twp.)		
Bartley, A. H. (Mount Olive Twp., Bartley Section, part)	Spring	
Bassett Park Association (Bassett Park Section of Mine Hill Twp.)	1 driven well, 102' deep	
Beach Haven (Municipality)	3 driven wells, 575'-613' deep	
Beaver Brook Water Co. (Lebanon)	Burs water from Clifton Water & Water Supply Co.	
Belmar (Municipality)	10 driven wells, 635' deep	
(South Belmar)		
(Wall Twp., West Belmar Section)		
Berlin (Municipality)	4 driven wells, 76'-368' deep	
(Berlin Twp., part)		
Bernards Water Company (Bernardsville)	Passaic River	
(Bernards Twp., Basking Ridge Section)		
Blackwood Water Company (Gloucester Twp., Blackwood Section)	1 driven well, 399' deep	Nos. 1 and 2 wells, 85' deep
Blair Water Company (Blairstown, Town)	2 driven wells, 800' deep	
Bloomsbury (Municipality)	Mountain springs	Musconetcong River
Bogota Water Company (Bogota)	1 driven well 180' deep	
Boonton (Municipality)	Stony Brook in Brook Valley	
(Boonton Twp., part)	2 driven wells, 38'-43' deep	
Bordentown (Municipality)	17 wells; 15 springs; 37 catch-basins and manholes on lines	
(Bordentown Twp., part)		
(Sells water to White Horse Water Company)		
Bound Brook Water Co. (Bound Brook)	East and west branches of Middle Brook at Chimney Rock	20 driven wells, 125'-150' deep
(Bridgewater Twp., part)		
(Middlesex Expo. part)		
(South Bound Brook)		
Branchville (Municipality)	Dry Brook, which is spring over-flows	Spring Brook Pond
Bridgeport (Municipality)	West branch of Cohansey River; also burs water from Fairbranks-Morse Water Supply Co.

STATE INSTITUTION WATER SUPPLIES IN NEW JERSEY

LOCATION	NAME OF INSTITUTION	SOURCE OF SUPPLY	TREATMENT
Annandale	State Reformatory for Men	Spring	
Clinton	State Reformatory for Women	1 driven well, 65' deep	Chlorination
Glen Gardner	New Jersey Hospital for Tuberculous Diseases	Rocky Run Brook	Chlorination
Greystone Park	State Hospital	Springs, tributary to Whippany River	Aeration and sand filtration (pressure) and iron removal
Juniataburg	State Home for Boys	2 driven wells, 500' deep	
Kentny	State Home for Soldiers	1 driven well, 600' deep; purchase water from Passaic Valley Water Commission	Rapid sand filtration (gravity) and chlorine disinfection
Leesburg	State Prison Farm	1 driven well, 34' deep	
New Lisbon	State Colony for Feeble-Minded Males	2 driven wells, 90' deep	
Skidman	State Village for Epileptics	Rock Brook, 2 driven wells, 150'-475' deep	
Trenton	State Home for Girls	1 driven well, 255' deep and Trenton City supply	
Trenton	State Hospital	9 driven wells (5 in use) 250'-585' deep and Trenton City supply	
Trenton	State School for the Deaf	2 driven wells, 125'-300' deep	
Vineyard	Home for Feeble-Minded Women	3 driven wells, 135' deep	
Vineyard	Home for Soldiers	1 driven well, 124' deep	
Vineyard	The Training School	3 driven wells, 110'-130' deep	
Woodbine	Home for Feeble-Minded Males	2 driven wells, 180' deep	

COUNTY INSTITUTION WATER SUPPLIES IN NEW JERSEY

LOCATION	NAME OF INSTITUTION	SOURCE OF SUPPLY	TREATMENT
Allenwood	Monmouth County Tuberculosis Hospital	1 driven well, 100' deep	
Branchville	Sussex County Almshouse	2 springs	
Bridgeton	Cumberland County Almshouse	1 driven well, 100' deep	
Bridgeport	Cumberland County Hospital for the Insane	1 driven well	
Cape May Court House	Cape May County Almshouse	1 driven well	
Cape May	Sussex County Hospital for the Insane	Driven wells	
Clarksville	Atlantic County Almshouse	Spring	
Egg Harbor City	Atlantic County District Home	1 well, 84' deep	Aeration
Grenloch	Camden County Institutions	4 driven wells, 115' deep	
Morris Plains	Morris County Almshouse	1 driven well	
Morris	Stoungton Sanatorium of Morris County	1 driven well	
New Lisbon	Springton County Hospital for the Insane	2 driven wells	
Northfield	Warren County Almshouse	2 driven wells	
Oxford	Warren County Almshouse	2 driven wells	
Scotch Plains	Round Barn Sanatorium of Union County	2 driven wells	Chlorination
Woodstown	Salem County Almshouse	1 dug well, 14' deep, 1 spring	

WATER SUPPLIES ABANDONED AS SOURCES FOR PUBLIC POTABLE PURPOSES

July 1, 1932, to June 30, 1934

LOCATION	OWNER	SOURCE OF SUPPLY	TREATMENT	DATE APPROVED	STUCK FROM ISSUING POTABLE WATER SUPPLIES
Hamilton Township (White Horse Section)	Thomas J. Parent	1 driven well, 84' deep		4-5-32	11-1-32
Isokous Township (Malwah Section)	John Winter	1 driven well		2-7-33
Jefferson Township (Lake Hopatcong Section)	Kenneth and Emma Brown (formerly Emma B. Wheeler)	Spring		5-13-26	2-7-33
North Brunswick Township	Municipality	1 driven well, 108' deep	Rapid sand filtration (gravity) and chlorination	9-14-30	7-13-32
Milford	Riegel Paper Corporation	Delaware River		4-7-25	9-15-33
Parshippany-Troy Hills Township	Purshippany Water Company	1 driven well, 292' deep		6-7-27	5-1-34
				9-19-28

The following table lists the municipal sewage treatment plants operating at the end of the fiscal year, June 30, 1934:

MUNICIPAL SEWAGE TREATMENT PLANTS IN NEW JERSEY

LOCATION	OWNERSHIP, MUNICIPALITY OR COMPANY	COUNTY IN WHICH PLANT IS LOCATED	MUNICIPALITIES OR LOCATIONS SERVED	Permanent Population, 1930 Census	Estimated Population Served
Allenhurst	Borough	Monmouth	Allenhurst	573*	573*
Asbury Park	City	Monmouth	Asbury Park	14,981*	14,981*
Atlantic City	City	Atlantic	Chelsea Heights Section	768*	768*

Bradley Beach (Ocean Park Ave. Plant) (District No. 1)	Borough	Monmouth	Bradley Beach	3,900*	2,000*
Bradley Beach (Evergreen Ave. Plant) (District No. 2)	Borough	Monmouth	Bradley Beach	3,900*	1,000*

MUNICIPAL SEWAGE TREATMENT PLANTS IN NEW JERSEY—Continued

LOCATION	Date of Approval or Revisions for Plant	Plant Placed in Operation	In-Construction of Plant	UNITS OF TREATMENT PLANT	SEWAGE FLOW IN G.P.G. PER DAY	EFFLUENT DISCHARGED INTO	PLANT FOR THE PREVENTION OF
Allenhurst	12-0-07	1908	1930	Sedimentation tanks, chlorinator and chlorine contact tank	**350,000 summer 4,000 winter	Atlantic Ocean	Pollutions of bathing or recreational waters and nuisances
Asbury Park	2-27-05	1905	Sedimentation tanks	**2,000,000 April, 1932	Atlantic Ocean	Pollutions of bathing or recreational waters and nuisances
Athletic City	12-2-24	1925	Five mechanical screens and chlorinator chamber and sedimentation tank	4,000,000 March, 1932	Beach Thoroughfare	Pollution of shellfish area
Athletic City (City Island Plant)	5-29-14 Amended 8-27-14 10-10-00	1921	Five mechanical screens and chlorinator chamber and sedimentation tank	**9,743,000	Beach Thoroughfare	Pollution of shellfish area
Athletic City (Halseigh Ave. Plant)	4-20-20	1911	1928	Five mechanical screens and chlorinator chamber and sedimentation tank	375,000	Inside Thoroughfare	Pollution of shellfish area
Athletic City (Texas Ave. Plant)	4-20-20	1921	1929	Five mechanical screens and chlorinator chamber and sedimentation tank	2,500,000	Beach Thoroughfare	Pollution of shellfish area
Athletic Highlands	7-5-27	1928	Sedimentation tanks, chlorinator and glass-covered sludge drying beds	600,000	Shady Hook Bay	Pollution of shellfish area
Audubon	4-2-12	1914	1930	Medium fine screens, chlorinator, final sedimentation tanks (and chlorinator contact combined), sludge digestion tank and glass-covered sludge drying beds	1,300,000	South Branch of New York Creek	Pollutions of bathing or recreational waters and nuisances
Aviston	8-11-14	1916	Sedimentation tanks, chlorinator and chlorine contact tank	Townsend's Inlet	Pollutions of bathing or recreational waters and nuisances
Avon	6-1-00	1900	1928 1929	Sedimentation tank, chlorinator and chlorine contact tank	400,000	Atlantic Ocean	Pollutions of bathing or recreational waters and nuisances

Barrington	4-2-29	1930	Grit chamber, preliminary sedimentation tanks, aeration tanks, final sedimentation tanks (with mechanical screens), chlorinator, primary and filters, chlorinator, chlorine contact tank, sludge digestion tanks and glass-covered sludge drying beds	600,000	Beaver Brook, tributary of Little Timber Creek	Pollutions of bathing or recreational waters and nuisances
Bay Head	5-2-10	1917	Final sedimentation tanks (and chlorinator contact combined), sludge digestion tank and glass-covered sludge drying beds	Barnegat Bay	Pollutions of shellfish area
Beach Haven	1-30-12	1913	1931	Sedimentation tanks, chlorinator and chlorine contact tank	700,000	Atlantic Ocean	Pollutions of bathing or recreational waters and nuisances
Belmar	1-13-09 Revised 4-10-10 6-3-24	1911 1925 1929	Sedimentation tanks, chlorinator and chlorine contact tank Sedimentation tanks, sprinkling apparatus, final settling tank (and chlorinator contact combined), filtration tanks and glass-covered sludge drying beds	800,000 2,500,000	Atlantic Ocean Tributary to Hackensack River	Pollutions of bathing or recreational waters and nuisances Pollutions of bathing or recreational waters and nuisances
Berkeley	12-0-02	1903	Five fine coarse bar screens, self-cleaning fine screens, aeration tanks, primary sedimentation tanks, chlorinator contact tank, sludge digestion tanks and glass-covered sludge drying beds	250,000	Mine Brook, North Branch Luritan River	Pollutions of bathing or recreational waters and nuisances
Beverly	8-10-00 Amended 8-20-12 1-21-13	1913 1914	Sludge digestion tanks and glass-covered sludge drying beds	35,000	Delaware River	Pollutions of bathing or recreational waters and nuisances
Bogota	1-2-23	1923	Inlet tanks, chlorinator and glass-covered sludge drying beds	1,150,000	Hackensack River	Pollutions of bathing or recreational waters and nuisances
Boonton	7-20-09	1911	Sedimentation tanks, contact beds, intermittent sand filters, chlorinator, chlorine contact tank, sludge digestion tanks and glass-covered sludge drying beds	2,000,000	Rockaway River	Pollution of potable waters
Bordentown	4-11-11	1911	Sedimentation tanks, chlorinator and chlorine contact tank	350,000	Black Creek, tributary to Delaware River	Pollution of potable waters
Bradley Beach (Ocean Park Ave. Plant) (District No. 1)	2-9-00	1911	Sedimentation tanks, chlorinator and chlorine contact tank	605,000	Atlantic Ocean	Pollutions of bathing or recreational waters and nuisances
Bradley Beach (Evergreen Ave. Plant) (District No. 2)	4-11-11	1911	Sedimentation tanks, chlorinator and chlorine contact tank	335,000	Atlantic Ocean	Pollutions of bathing or recreational waters and nuisances

Report of the Bureau of Food and Drugs

For the Year Ending June 30, 1934

W. W. SCOFIELD, CHIEF

This Bureau enforces laws passed by the Legislature to prevent the adulteration, misbranding, and substitution of inferior articles for standard foods and drugs. The Food and Drug Act of this State passed in 1907 is in harmony with the provisions of the Federal Food and Drug Act, and this law has been amended by the passage of several acts, such as the Sanitary Act, the Non-Alcoholic Beverage Act, the Act prohibiting the use of Sulphites in Meats, the Act governing the manufacture and distribution of Ice Cream, and the Act governing the production, handling and distribution of Milk, Cream and Milk Products. In addition to these acts, the Legislature has passed special laws governing the distribution and sale of Oleomargarine, the "Filled" Milk Act, the Methyl Alcohol Act, the Cold Storage Act, the Slaughterhouse Act, and the Egg-Breaking Act.

In the spring of 1934 this Bureau was charged with the enforcement of the laws of this State and of the regulations adopted by this Department governing the sale and distribution of shellfish.

Chapter 131 of the Laws of 1932, the act which fixed detailed requirements governing the production, handling and distribution of milk and cream, was amended by the Legislature of 1933. The most important change brought about by this amendment was to require that a permit be secured from the Department of Health of this State for each milk plant, at which milk was collected or assembled from a dairy or dairies, and from which milk plant it was intended to distribute milk, cream or milk products in this State. This change in the law was made necessary because

of the fact that Chapter 131 of the Laws of 1932 had been considered to be unconstitutional, in that permits were required to be obtained from this Department to import milk or cream only. Certain minor corrections in the milk law of 1932 were also passed by the Legislature in this amendment, although the fundamental requirements governing the production, handling, and distribution of milk were not materially changed. The act fixed an annual fee of \$25 for each permit granted under this act, and also provided that the Department of Health of this State be authorized to utilize the money collected for these permits in the enforcement of this law.

During the months of July, August and September of 1933 the agents of this Department made 541 inspections of dairy farms located in the States of Pennsylvania, New York, Delaware and Maryland. In certain cases where the requirements governing the production of milk were being violated, hearings before the Milk Committee of this Department were held and permits were revoked by the Department. During the course of the winter, most of the work of inspection was confined to the milk plants and dairy farms of this State. Where several requirements governing the production of milk were being violated, letters of advice and warning were sent to the dairymen. In these cases reinspections were made after a reasonable time had elapsed, and where little or no progress in bringing the conditions on the farms, or the methods used in the production of milk, up to the requirements, drastic action was taken by notifying the persons or firms operating the milk plants to which the milk was delivered to discontinue the receipt of milk, until the milk was produced in conformity with the requirements of the law. In those cases where violations of the law were found upon reinspection of the premises from which milk was distributed directly to the consumers, notices were sent directly to the dairymen notifying them to discontinue the sale of milk until such time as the milk was produced in conformity with the requirements of law, and copies of such notices were sent to the local boards of health of those municipalities in which milk was distributed.

During the months of April, May and June of 1934 our agents were again sent into other states to make inspections of milk

plants and dairy farms supplying milk to this State. It has been necessary to take drastic action in the case of several of these milk supplies located in other States by the revocation of permits or by notification to the operators of the milk plants to discontinue the receipt of milk from certain dairymen.

Throughout this year the Bureau has co-operated with the Milk Control Board of this State by furnishing that board definite information regarding action taken by this Department. At the meeting held on May 1st, the following resolution was adopted by the State Board of Health:

"WHEREAS, The milk control law gives the Milk Control Board the right to license supplies of milk being sold in New Jersey and it is uneconomic for the State Department of Health to inspect supplies that will not be approved by the Milk Control Board; therefore,
Be It Resolved, That the State Department of Health grant no more milk permits without first securing the approval of the Milk Control Board."

The most outstanding conclusion to be drawn from this work is the fact that operators of milk plants and dairymen have co-operated most heartily in making those changes in their milk plants or on their dairy farms necessary to conform to the requirements of this law. With very few exceptions, a marked improvement has been noticed in the conditions under which milk is produced over those conditions which existed a few years ago.

During the year 571 permits at \$25 each were issued for the operation of 571 milk plants, making a total of \$14,275, which amount was submitted to the State Treasurer.

The following table shows the number of inspections which have been made by agents of this Department of milk plants, together with the number of farms supplying milk to them, in each of the States from which milk, cream or milk products are distributed in New Jersey.

<i>State</i>	<i>No. of Milk Plants</i>	<i>No. of Dairies</i>
Pennsylvania	34	1658
New York	33	1114
Maryland	9	331
Delaware	6	157
	<hr style="width: 100%; border: 0; border-top: 1px solid black; margin: 5px 0;"/> 82	<hr style="width: 100%; border: 0; border-top: 1px solid black; margin: 5px 0;"/> 3260

This act also provided that inspections of dairy farms and milk plants were to be made by representatives of the local boards of health of those municipalities of this State in which the milk was distributed. Arrangements were made with those boards of health of this State maintaining dairy farm inspection for the submission to this Department of copies of the reports of inspections of dairies and milk plants made by their agents. This co-operative arrangement has prevented much of the duplication which would be likely to exist and has also furnished a vast amount of information to this Department. By means of this co-operative work, it has been possible for this Department to secure accurate, detailed information regarding every supply of milk or cream which is distributed in this State.

The following table shows the number of reports of inspections of dairy farms and of milk plants received from local boards of health of this State:

State	No. of Milk Plants	No. of Dairies
New York	75	5029
Pennsylvania	26	2549
Wisconsin	6	1519
Indiana	3	639
	<hr/> 110	<hr/> 9736

This Bureau gratefully acknowledges the receipt of these detailed reports of inspections of dairies and milk plants and desires to point out that the success in the enforcement of this work is due to the combined efforts of these agencies.

Physical Examination of Dairy Cows—Under the provisions of Chapter 243 of the Laws of 1933, physical examinations of dairy animals used in the production of milk intended for sale in this State are required to be made by veterinarians licensed in the states in which the herds are located, and reports of these examinations are to be filed at the milk plants to which the milk is delivered, or on the dairy farms in case the milk is distributed directly to the consumers. These reports are being checked by the agents of this Department as inspections are made of the milk plants and requests are made of the operators of the milk plants to ascertain

the final disposition of those animals which are found to be unfit for the production of milk as a result of this physical examination.

Physical Examination of Employees of Milk Plants—As pointed out in the report of this Bureau for the fiscal year ending June 30, 1933, this Department had not been in a position to make laboratory examinations of bodily discharges from milk plant employees, because of the inadequate facilities of the laboratory of this Department. With the completion of our new laboratories, the enforcement of this section of the law was undertaken, and the Milk Committee of this Department decided to require the submission of specimens of feces and urine from those persons who were engaged in the handling of milk in milk plants, to the laboratory of this Department or to a private laboratory approved to make such examinations. The co-operation of the persons in charge of milk plants was solicited to make this physical examination of employees a thorough one. The employees of a large number of milk plants of this State have submitted to this examination and it is hoped within the next few months to complete this work in all milk plants in the State of New Jersey.

Collection of Milk, Cream and Milk Products—During the year 4,115 samples of milk and cream collected by agents of this Department were examined chemically. None of these samples contained preservatives and a very small number of samples of milk had been adulterated with water. A small percentage of the samples collected failed to meet the legal standards for total solids or for milk fat.

Sediment Tests—Sediment tests have been made of milk as delivered by dairymen to the consumers or to the milk receiving station. The dirt contained in a pint sample of milk is collected on a cotton disc by filtering the milk through the disc. In those cases in which an undue amount of dirt appears on the disc, the dairyman is advised of the findings and of the necessity for producing clean milk. The disc with the dirt is also mailed to the dairyman. Good results have been obtained by sending the dirty discs to the dairymen, as the sight of the dirt removed from milk produced on their premises causes interest and the desire on the part of most dairymen to avoid similar humiliation in the future.

New Legislation—During the present year the Legislature passed an act, which provides that on and after January 1, 1935, no person, firm, association or corporation shall ship, import, export, offer for sale, resale or distribution to consumers or for manufacture as ice cream within the State of New Jersey, milk and/or cream unless such milk and/or cream is produced by cows which have successfully passed an official tuberculin test made under the individual accredited herd plan or modified accredited area plan. This Department was granted authority to make and promulgate such orders and regulations as may be necessary for the proper enforcement of the provisions of this act. Conferences are now being held between officials of this Bureau and of the Bureau of Animal Industry of the Department of Agriculture of this State, for the purpose of agreeing upon proper regulations for the enforcement of this act.

Ice Cream Factory Inspection—The Association of Ice Cream Manufacturers of Pennsylvania and New Jersey had a bill introduced in the Legislature, which had for its purpose the licensing of establishments in which ice cream, sherbets, or ices were prepared for distribution in this State, and also the establishment of higher standards for ice cream. The Legislature of this State passed an act known as Chapter 271 of the Laws of 1933, in June of 1933. In this act a fee for licenses was fixed at \$25 for each ice cream establishment in which a quantity not in excess of 100,000 gallons annually was prepared for distribution in this State, and a fee of \$50 for those establishments in which a quantity in excess of 100,000 gallons annually was prepared. The standard for ice cream was changed from a minimum fat content of 8 per cent. milk fat in the case of plain ice cream to a minimum fat content of 10 per cent. In case fruit or nuts were used in the preparation of ice cream, the minimum fat content was changed from 6 per cent. milk fat to 8 per cent. milk fat. The act defined ice cream, frozen custard, sherbet, ice and imitation ice cream.

A large number of protests were received by this Department from those manufacturers of ice cream making less than 10,000 gallons annually, because of the excessively high fee fixed by the act for licenses to conduct small establishments in comparison with

the fee fixed for the large establishments. As a result of these protests, the Department requested representatives of the two associations of ice cream manufacturers, the Association of Ice Cream Manufacturers of Pennsylvania and New Jersey, and the New Jersey Retail Ice Cream and Candy Manufacturers Association, Inc., to consider the advisability of changing the fees for licenses to a more reasonable basis. These associations agreed to this suggestion and an amendment was introduced into the Legislature and passed in December, 1933. This amendment fixed the fees from a minimum of \$5 to a maximum of \$100 annually.

During the year 422 licenses have been issued, the fees for which amounted to \$5,150, which was paid into the State Treasury. The amendment passed in December, 1933, also authorized this Department to utilize the funds collected as fees for licenses in the enforcement of the act. In the spring of 1934 the Department employed one agent to enforce the provisions of this act. During the year 905 inspections have been made of the establishments at which ice cream is manufactured for distribution in New Jersey and 758 samples have been collected for examination. Of this number of samples 125 have been found to differ from the standard fixed in the act.

Non-Alcoholic Beverage and Bottled Water Plant Inspection—During the year 297 inspections were made of beverage and water bottling plants in this State and 96 samples of non-alcoholic beverages and bottled water were collected. Emphasis has been placed upon the necessity of cleaning bottles and utensils thoroughly. Close examination has been made of the syrups used in preparing non-alcoholic beverages and action has been taken to require the proper labeling of beverages prepared from imitation flavorings to provide that the beverages be labeled with the words "artificial" or "imitation" in letters of the same size type as the name of the product imitated.

In the case of the water bottling plants, samples of water have been taken from filled bottles and also from the pipe lines in the bottling rooms. In several cases the water was found to show evidences of contamination and notices have been forwarded to the operators of these establishments, ordering them to discontinue

the sale of such polluted water until such time as the water is free from contamination.

Slaughter-House Inspection—During the year 41 inspections have been made of slaughter-houses. These establishments were found to be operated in substantial compliance with the laws of this State.

Canning Factory Inspection—During the canning season inspections have been made of all of the canning factories operating in New Jersey, for the purpose of ascertaining the conditions under which foods were being packed. As in past years, particular attention was given to the sorting of the raw material to prevent the packing of decomposed foods. The reports of these inspections prove that the canning factories of this State were being operated in general conformity with the laws governing this industry. Representative samples of the canned foods were collected and were examined in the laboratory of this Department. No cases of adulteration or misbranding of these products were found.

Alcoholic Beverages—The repeal of the Eighteenth Amendment, effective in December, 1933, resulted in the resumption of the legal sale of alcoholic beverages in this State. Under the Food and Drug Act of this State, the term "drug" shall include all medicines and preparations recognized in the United States Pharmacopoeia or National Formulary for internal or external use, and any substance or mixture of substances intended to be used internally or externally for the cure, mitigation, or prevention of disease of man or animal. The term "food" is also defined in this act as every article used for food or drink by man or animal, and every ingredient of such article, and all confectionery and condiments.

Whiskey or brandy sold under labels indicating that the products were intended for medicinal use were regarded as "drugs" and other alcoholic beverages were regarded as "food" under these definitions.

It seemed necessary that an investigation be made of the alcoholic beverages which were prepared or distributed within this State. Inspections were made of the establishments at which

alcoholic beverages were bottled, and detailed information was secured at these bottling establishments regarding the ingredients which were used in the different beverages. Copies of the labels used on the containers of such beverages were also secured. Representative samples of the beverages were collected and in certain instances violations of the Food and Drug Act were discovered. Prosecutions were authorized by the Department of Health of this State and several penalties have been collected.

Sanitary Shellfish Control—At the beginning of the year the shellfish activities of the Department were in charge of a special committee of the Board headed by J. Oliver McDonald, M.D. The Board subsequently established a separate Bureau of Sanitary Shellfish Control with Dr. McDonald as Chief. Unfortunately, he passed away shortly after assuming direction of the Bureau, which was thereupon attached to the Bureau of Food and Drugs, W. W. Scofield, Chief, as a subdivision.

Certain areas closed to the taking of shellfish in the vicinity of Wildwood were patrolled during July and August to prevent summer visitors and baymen securing shellfish which might be potentially dangerous to health.

Early in October a field laboratory was established at Bivalve, New Jersey, and sanitary surveys and bacteriological examinations of shellfish and the waters of Maurice River were conducted for a period of one month. This investigation was co-operated in by the U. S. Department of Agriculture, U. S. Public Health Service and this Bureau. The report of the assistant bacteriologist of the U. S. Department of Agriculture states that collectively many minor sources of pollution from Millville to Northwest Reach at the mouth of the river are responsible for the questionable sanitary condition of the waters used in the floating operations. The report further states that while under certain climatic conditions, or at certain stages of tidal flow the instance of fecal B. coli in the waters at the floating areas may not be excessive, the demonstration of frequently recurring pollution of these areas casts suspicion on the waters of Maurice River as to their suitability for shellfish production.

A resolution of the Board was passed on October 3, 1933, stating "that on and after July 1, 1934, shellfish shall not be floated or stored in water of less purity than that in which they are grown, and under no circumstances from waters determined to be contaminated by the State Department of Health." Investigations have been carried on to determine the sanitary quality of waters from which shellfish are taken and the waters used for floating or wet storage of shellfish prior to shipment. It was necessary to order closed to the wet storage of oysters two creeks along the Atlantic coast for such time as weather conditions rendered bacterial scores obtained from these shellfish in excess of the permitted standards. Subsequent studies of questionable areas have been presented to the Board for consideration and the establishment of policies for the future conduct of such storage operations.

During the year the western portion of Raritan Bay was reopened for the gathering of shellfish, and areas in the Shrewsbury River and adjacent to Ocean City reopened for a limited time during cold weather.

In March a special allotment of \$15,000 was secured from the State House Commission and construction was started on three experimental plants for the wet storage of shellfish in sterilized water. Two of these plants located on Tuckerton Creek and Absecon Creek were completed, and the third one on Oyster Creek at Leeds Point nearly so. These plants are so designed as to provide water pumped from the creeks at the location of the present floats, which, after sterilization with chlorine, is stored in a large concrete tank, and may then be distributed to each shucking house through pipes which have been laid underground and a connection carried to each existing shipping house. In this connection experiments were carried on in a specially equipped experimental shellfish floating tank at Bivalve, jointly with the oyster investigational laboratory of the New Jersey Agricultural Experiment Station located at that point. It is believed that with the data secured from these experiments and others which have been made by this Department, and from observation of similar plants in Massachusetts and on Long Island, these experimental commercial plants can be operated at a low cost. By treating shell-

fish by this method the benefits of wet storage or conditioning may be secured without the dangers of contaminating the shellfish by polluted waters. A special investigation was made during June of the waters of Shark River with reference to the possibility of their having caused disease. The investigation disclosed that the waters of Shark River were satisfactory for bathing and shellfish growing purposes and could not be considered responsible for the cases of disease reported in that vicinity.

Report of the Bureau of Bacteriology

For the Year Ending June 30, 1934

J. V. MULCAHY, CHIEF

The period covered in this report of the Bureau of Bacteriology for the year ending June 30, 1934 has been an unusually busy time as shown in the tabulations at the end of this report.

It was commented in last year's report that a decided increase in the number of examinations had been made over those of any preceding year. The continued increasing use of the facilities of the laboratory is reflected in a notable increase during the past year in all phases of the work.

Last year the total number of specimens examined from all kinds of suspected communicable diseases and from various types of food handlers was 73,339, while during this past year 91,158 specimens were examined. This is an increase of 17,810 examinations.

It is indeed fortunate that ample space is now available to carry on this work as it would have been a physical impossibility to handle this volume of work without the additional rooms assigned to this bureau which have been occupied since the first of the past fiscal year.

These three new rooms have been adequately equipped and so conveniently arranged that the increased work can be more satisfactorily handled without the crowded and unfavorable working conditions prevailing in our older cramped quarters. By the rearrangement of rooms it has been possible to assign an additional room for the laboratory assistants charged with the preparation of culture media and the assembling of mailing cases for the collection of specimens. This has taken these workers out of the

wash room where they formerly worked, allowing additional space in the wash room to those assigned to the cleaning of glassware.

A noteworthy improvement has been made to our animal room this year. Through the co-operation of the State House Commission and with the use of C. W. A. workers, this room has been enlarged, providing more than three times additional space. Before this enlargement the animal room was too small to care properly for the animals and was badly overcrowded. The present room is well lighted, has ample space and is well ventilated, and allows for the proper care of additional animals needed to care for the increased work.

A new floor has been laid and ample shelf and cupboard space has been provided in our storage space under the roof, now making this space very satisfactory and well adapted for storing glassware and laboratory supplies.

Acknowledgment of the appreciation of the department for these improvements was conveyed to the State House Commission in a letter sent by the Director.

The following table shows the number of specimens from various cases of suspected communicable diseases examined during the year, making a total number of 91,158.

TABLE I

Total Number of Specimens Examined During the Fiscal Year Ending June 30, 1934

Diphtheria	9,863
Tuberculosis	9,203
Typhoid fever	3,613
Typhoid bacilli (feces and urine)	7,053
Gonorrhoea	6,143
Syphilis	50,695
Miscellaneous specimens	4,588
Total	91,158

There has been an increased number of examinations made in every type of specimens shown in this table, compared with a similar table in the report of this bureau for last year.

We have made 2,607 more examinations for diphtheria, 1,588 more examinations for tuberculosis, 518 more blood specimens

for typhoid fever, 3,017 more examinations of feces and urine for typhoid bacilli, 9,135 more examinations of blood specimens for evidence of syphilis, and 594 more miscellaneous examinations.

It will be seen that the largest increase was in the specimens examined for syphilis by means of the Wassermann and Kahn test, and in the specimens of feces and urine examined for typhoid bacilli, both time-consuming examinations.

This additional work has kept the entire force very busy and I wish to express my appreciation for the conscientious and faithful way that they have performed their duties, often requiring considerable overtime to finish their assigned tasks.

TABLE II

Yearly Totals of Animals Examined for Rabies from 1925 to 1934, Inclusive

	1925	1926	1927	1928	1929	1930	1931	1932	1933	1934
Positive	160	202	164	93	106	96	80	177	130	86
Negative	116	145	132	116	115	121	114	123	121	93
Unsatisfactory..	18	25	26	19	22	11	8	27	21	10
Total	294	372	322	228	243	228	202	327	272	189

This tables gives a yearly comparison of examinations made on different animal brains sent to the laboratory for examination for evidence of rabies. This disease has been prevalent for some years in this State, and while the number found to be rabid in this laboratory during the past year is less than either of the past two years, rabies, however, has been unusually prevalent in the northern section of the State, which does not show in this table as many suspected animals are examined in laboratories situated in the northern part of the State.

Reports are received by the department of the occurrence of rabies throughout the State, and these records show that 223 animals, mostly dogs, were found rabid during the year.

Of the specimens of animals' heads, mostly dogs' heads, sent to this laboratory for examination for rabies, a certain number are received in an unsatisfactory condition for examination. Attention has been directed in past reports of this bureau and in

publications of this department, to the need of careful icing of the specimen when shipping an animal's head for laboratory examination, and cautioning against injury to the brain when the animal is killed.

In most instances these precautions are observed, but it will be seen in Table XIII that nine dogs and one cat were in such an unsatisfactory condition that no examination could be made.

In Table XI is shown miscellaneous examinations made during the year, comprising specimens examined from a number of different kinds of suspected infections. Some of these examinations are always of particular interest because they sometimes reveal the presence of unusual infections.

It will be seen in this table that an examination of a specimen of home-prepared sausage showed the presence of *Trichinella spiralis*. This pork had been consumed by members of the family who prepared this product, and several of their friends, all of whom were made sick.

It was not until an epidemiological investigation had been made of these cases and a history of eating this pork product had been obtained and the laboratory findings reported, that a correct diagnosis was made on these cases.

This specimen of sausage received showed the presence of numerous encysted larvae, and the ingestion of this insufficiently cooked pork was responsible for twelve cases of trichinosis resulting in two deaths.

The presence of a case of cerebro spinal meningitis at Camp Dix, at that time used as a concentration camp for men going to different C. C. Camps, resulted in a request from the medical officer that this laboratory examine specimens from the men in contact with this case. Special swabs for the collection of these specimens were furnished, and an examination made of these specimens for the presence of meningococci from these contacts.

Much additional work has been done in the laboratory for Federal Government agencies using the laboratory for the examination of specimens from food handlers in the different C. C. Camps in the State, and in the examination of other bacteriological specimens.

For several months four assistants were assigned to the laboratory to assist with this additional work under a State project for unemployment relief, but this project was discontinued even though the examination of specimens from these camps continued.

The recognition of cases of amoebic dysentery in this State contracted through the ingestion of infected foods or drinks while guests at two hotels in Chicago, resulted in an increased demand in laboratory facilities for the examination of feces specimens for the presence of the causative organisms in suspected cases of this disease.

This Bureau is prepared to assist the physicians of the State in the diagnosis of suspicious cases of amoebic dysentery by the examination of specimens of feces if they can be sent in a fresh condition shortly after passage and kept in a warm condition during transit.

The organism found usually in large numbers in the stools of cases of this disease is the organism *Endamoeba Histolytica*, and can be detected by microscopic examination of the freshly collected warm specimens.

Two methods for the examination of *Endamoeba Histolytica* have been used for the identification of this organism. One of these methods is to examine a thin film of freshly collected warm feces on a glass slide covered with a cover glass, and an examination made under the microscope for the actively motile organism. The appearance of the endamoeba in a warm preparation shows the characteristic ameboid motion, constantly changing its shape or moving about by means of distinct pseudopodia. This motion is a striking feature of the vegetative form of this parasite. Another feature that is valuable in the identification of this organism is the presence of ingested blood corpuscles. These organisms are most likely to be found if care is taken to examine grayish or blood-streaked particles of mucous, if present in the feces.

The other microscopic method is the examination of a stained specimen of feces to demonstrate the characteristic structure. With this method the appearance of the nucleus in the vegetative forms and the presence of ingested blood cells serves to differentiate *Endamoeba Histolytica* from other amoeba.

A more detailed description of these methods together with methods for the cultivation of this organism is given in an article published in the Public Health News issue of January, 1934.

During the year, 555 specimens have been examined for the presence of amoeba, most of these specimens, however, being received from food handlers in a hotel. The owners of this hotel requested the examination of all food handlers, not only for amoeba but for typhoid carriers and for evidence of syphilitic infection. These specimens were sent in through the physician connected with this hotel.

In Table XII is shown the examinations made for evidence of Undulant fever, and examinations made on milk samples for agglutination tests for *B. Abortus* infections in the animal.

It will be seen that of the 334 specimens of human blood examined for evidence of Undulant fever 37 of these specimens gave a reaction in a dilution of 1-80 or higher.

Of the 18 specimens of cows' blood showing agglutinins of *B. Abortus*, 9 of these were found in one herd. These samples were collected from this herd as it was suspected that the milk from this herd was responsible for several cases of Undulant fever. Guinea pig inoculations were made from these specimens of milk, giving an agglutination in dilutions of 1-100 or over. These tests are now under way for the purpose of isolating *B. Abortus* in these experimental animals found to be affected as the result of the injection of these samples of milk.

Table XV shows the number of mailing cases prepared for shipment to various repositories located in drug stores and offices of local boards of health, and in many instances directly to the physicians of the State. These outfits are distributed for the collection and transmission of specimens from suspected cases of communicable diseases and comply with the postal regulations relating to the transmission of diseased material through the mail.

The assembling of almost 110,000 of these outfits, involving as it does the preparation of sterile swabs, vials and other glassware, has kept those engaged with this phase of the laboratory work very busy.

This same force, consisting of five laboratory assistants, tubes, bottles and sterilizes all the culture media used by the Bureau of Bacteriology, besides all the culture media used in the examination of water and sewage samples for use in the water laboratory, and for all field work in water and sewage purification work done by the engineering force of this department.

The demand for culture media is growing larger constantly as the number of water and sewage samples increase, and a larger engineering force is put in the field to collect samples in the operation of these purification plants.

We received and filled orders for media totaling over 5,000 liters, requiring several hundred thousand tubes and bottles. This demand has kept our limited number of autoclaves running at capacity most of the time.

During the year, groups from nurses training schools, colleges and other interested groups have visited the laboratory to observe the procedure followed in a public health laboratory.

An assortment of biological products is kept in stock, including smallpox vaccine, Schick test material, diphtheria toxoid and toxin-antitoxin, typhoid and paratyphoid bacterin, scarlet fever toxin for the Dick test, and tetanus anti-toxin. These products are supplied at cost to physicians and health officials doing immunization work in clinics and school groups and a considerable amount is taken by the epidemiologists connected with the Bureau of Local Health Administration when assisting with the immunization of various groups in State institutions, and in cooperation with physicians and health officials throughout the State.

In the tabulations that follow is shown the various examinations made and the number examined in this Bureau during the year, arranged and classified under the name of the disease for which they were examined.

Report of the Bureau of Chemistry

For the Year Ending June 30, 1934

J. E. BACON, CHIEF

The Bureau of Chemistry makes chemical and bacteriological examinations of samples of foods, drugs, sewage and trade wastes collected by the Department's representatives in the enforcement of the Pure Food and Drug Act and of the Public Health Laws of New Jersey. The facilities of the laboratory are also extended to local boards of health, State Department of Public Instruction, State Purchasing Agent, New Jersey State Police, State Board of Pharmacy, and the Fish and Game Commission. Analyses are also made of various samples of foods and supplies purchased under specifications for institutional use, drugs collected by the inspectors of the State Board of Pharmacy, rural school waters submitted by local boards of education, water supplies from camps maintained by benevolent associations and other miscellaneous samples.

Assistance is given to local boards of health and water works laboratories desiring to install chemical control or supplement existing laboratory facilities. Instructions in chemical procedures are given the personnel of such laboratories when requested.

The Bureau makes investigations of those establishments producing chemicals which give rise to obnoxious, objectionable fumes and furnishes expert advice to local boards of health to assist in abatement of such nuisances.

There was an increase of 7.5 per cent. in the number of samples analyzed in the water laboratory, making an increase of 69.0 per cent. in the number of samples examined this year over two years ago. The addition of one chemist and one technician to the personnel commencing with the new fiscal year will enable the Bureau to study some chemical problems next year which it has

been impossible to investigate in the past. For instance, "mottling" of teeth in course of formation is claimed to be produced when the fluorine in drinking water exceeds one to two parts per million. An early study of the fluorine content of the public water supplies of New Jersey is contemplated.

Sixteen thousand, one hundred and fifty-nine samples of food, drugs, water, sewage and miscellaneous preparations have been examined during the past year. The tabulations indicate the variety of products analyzed.

TABLE SHOWING NUMBER AND CHARACTER OF SAMPLES EXAMINED IN THE
FOOD AND DRUG LABORATORY DURING THE FISCAL YEAR
ENDING JUNE 30, 1934

	<i>Above Standard</i>	<i>Below Standard</i>	<i>Total</i>

Report of the Bureau of Child Hygiene

For the Calendar Year 1933

JULIUS LEVY, M.D., CONSULTANT

INFANT MORTALITY

The infant mortality rate for New Jersey for 1933 was 46 per 1,000 live births. This is the lowest rate ever reported in the State of New Jersey and represents a further reduction of approximately 10 per cent. over the rate of last year.

It is particularly interesting to note that since 1929 there has been a continuous reduction in the infant mortality rate, the rate of 1933 being approximately 25 per cent. lower than the rate of 1929. The total number of births has also shown a continuous decrease since 1929; 1933 presenting practically a decrease of 18 per cent. over 1929 in total births. Practically all the reductions in the mortality of the first year have occurred in the period over 1 month—the mortality in the first days and weeks presenting very little variations over a period of some 14 years. One may correlate with this fact that the maternal mortality rate has shown practically a very slight variation for the past 14 years.

These early infant deaths are effected by the same factors that influence maternal mortality and will be reduced to any considerable degree only when we succeed in obtaining for mothers and new-born infants the care that scientific knowledge clearly indicates.

All but two of the 21 counties had infant mortality rates under 60, and two counties had infant mortality rates under 40.

This clearly indicates that not only the infant mortality rate for the State as a whole is exceedingly low but that this has been obtained by a general uniformity of low infant mortality rates in all of the counties.

Of the 10 larger cities, only one presents an infant mortality rate over 60, while two present infant mortality rates under 40.

The lowest infant mortality rate among cities with a population between 50,000 and 100,000 was found in Irvington with a rate of 30. Atlantic City presented the highest rate with 57.

HEALTH SUPERVISION

In spite of the serious economic depression, the Department was able to maintain health supervision of children in most of the communities in which it had been previously established.

At the present time, 435 communities are carrying on the State Child Hygiene Program under the supervision of this Bureau. There are 144 field nurses of whom 118 are entirely paid by the communities in which they work; 17 partly paid and only 9 entirely paid by the State Department. During the year as the result of very intensive extension work, the salaries of 9 nurses, who had temporarily been taken over by the State Department, were reassumed by the communities in which they had been working. One new community assumed the whole salary of the nurse and 20 communities in some 7 different counties assumed part of the salary of the nurses working in their communities.

The continuous Child Hygiene Program has been maintained along the lines established in previous years with the result that each Child Hygiene nurse supervises in a community the expectant mothers, new-born infants, preschool and school children.

Where the nurse has been in a community for a sufficient period, school authorities have recognized that the children come to school in a much healthier condition and free from many of the defects that interfere with proper school progress.

Our attention has been called by one supervising dentist to his observation that the children entering school in a community where the Child Hygiene nurse has been supervising the care of infants for 5 years, have teeth practically free from caries.

EMERGENCY RELIEF

Through very active co-operation with the Emergency Relief Administration, it has been possible to make available to families extra milk and additional foods for all children and so to maintain to a very unexpected degree the general healthfulness and nutrition of the children, especially in those communities where the Child Hygiene nurses have been established. The nurses have not only brought family situations to the attention of the Emergency Relief but through their regular visits in the homes have been able to instruct mothers in the proper purchasing and preparation of foods.

COOKING CLASSES

In certain counties cooking classes were organized in co-operation with the County Demonstration Agent of the Home Economics Department of the State Agricultural College and the representatives of the County Emergency Relief. In all, 14 classes were held in Atlantic, Bergen and Cape May Counties with the mothers on the Emergency Relief.

CIVIL WORKS SURVEY

During the latter part of 1933, we were asked to prepare plans to assist the Emergency Relief Administration to make available work for women. As a result a Child Health Survey was developed which employed for a period of about four months about 250 persons, of which 100 were nurses and 130 investigators, clerks and stenographers. As a result of this survey information in regard to the status of medical health examinations, dental health examinations, immunization against diphtheria, vaccination against smallpox, has been made available to respective boards of health to enable them to conduct an intensive educational campaign further to develop these child health protective measures.

CO-OPERATION WITH PUBLIC HEALTH COMMITTEE OF THE
STATE MEDICAL SOCIETY

Our nurses have been instructed actively to co-operate with the county medical societies in their present plan to have all children immunized and vaccinated before the age of 2, by physicians in their offices.

MENTAL HYGIENE CONFERENCES

With the ever-increasing interest in mental hygiene, we became convinced that there was an excellent opportunity for this department through the Child Hygiene nurses to carry on an effective educational, preventive mental hygiene campaign.

Studies of many of the neurosis and psychosis, of juvenile delinquencies, of maladjustments of school children, have indicated that many of the difficulties result from the early parent-child relationships and the development or absence of certain habits and attitudes.

The Child Hygiene nurse, through her regular visits to expectant mothers, new-born infants and preschool children, has an opportunity to make clear to parents the importance of their attitudes on the future emotional make-up of the child.

In order to prepare the nurse for this newer type of work, a series of conferences was arranged for the year 1934. It is our plan to have the supervisors obtain intensive instructions in this field and to try to develop this form of mental hygiene work as part of the regular work of the Child Hygiene nurses.

STATISTICAL SUMMARY

Mortality rates are per 1,000 live births.

Infant mortality	46
Under one month	27
Stillbirths	36
Puerperal deaths	5.1

One hundred and forty-four nurses supervised 6,474 expectant mothers, 21,082 babies, 35,288 preschool children and 113,830 school children.

118 nurses were paid by the communities in which they work
17 nurses were paid partly by the community and partly by the State
9 nurses were paid entirely by the State Department of Health.

Four hundred and thirty-five communities carried on the State Child Hygiene Program under State supervision.

One hundred and forty-four baby keep-well stations were conducted weekly. Thirteen district supervisors supervised in addition to the Child Hygiene nurses, 380 of the midwives of the State.

One community assumed the salary of the nurse. Salaries or parts of salaries for 9 nurses were temporarily re-assumed by the State Department of Health due to financial conditions in local communities. The communities again assumed the salaries as soon as finances permitted.

There were 56,063 births in 1933, a decrease of 8 per cent. in the number of births over 1932.

Visits made in the homes by the nurses	304,991
To expectant mothers	27,543
To babies	120,344
To children of preschool age	100,089
To school children	57,015
Visits to Baby Keep-Well Stations	106,080
By babies	78,578
By preschool children	27,502
Prenatal Advice (expectant mothers)—	
Supervised prenatal cases	6,474
Address changed before delivery	311
Pregnancies ended	3,840
Live births	3,702
Stillbirths	89
Miscarriages	49
Maternal deaths	9
Attendants at births—	
Doctor or hospital	3,272
Midwife	560
No attendant	8
Infant care—	
Babies supervised	21,082
New cases	10,610
Preschool care—	
Children supervised (ages 1 to 6)	35,288
New cases	10,304
Illnesses and defects (not including school child)—	
Detected	9,661
Corrected	6,319
Contagious diseases—	
Suspected cases discovered	1,863
Unsanitary conditions discovered	708
Eye smears taken	22
Suspected tuberculosis cases referred	822

Preschools and babies receiving toxin anti-toxin	3,709
Preschools vaccinated	561
Attendance at Little Mother Leagues	92
Unreported births discovered	8
School children supervised	113,830
Inspections (annual, general, classroom, assisting doctor)	1,121,284
Defects detected	119,659
Defects corrected	42,356
Illnesses detected	4,437
Pupils excluded by principal	15,113
School children receiving toxin anti-toxin	3,671
Nose and throat cultures taken for diphtheria	279

MIDWIFERY

During the year 1933 there were 433 licensed registered midwives in the State of New Jersey. Three hundred and eighty of these were supervised by the State Department of Health, 45 were under local supervision in Jersey City and 8 were from out of State. This was an increase of four midwives as compared with last year.

Of the 380 licensed supervised midwives, 164 midwives each delivered more than 12 cases a year; 152 delivered less than 12 cases a year and 64 did not deliver any during the year. The last two groups have increased considerably because there has been a decided decrease in the activities of all midwives.

UNLICENSED MIDWIVES

In 1933 one unlicensed midwife was referred for prosecution to the State Board of Medical Examiners with evidence of having delivered three cases. Action pending.

NUMBER OF CASES DELIVERED BY MIDWIVES

The total births in 1932 was 61,215; in 1933, 56,072, giving a decrease of 5,143. The total births delivered by midwives in 1932 was 6,841 or 11 per cent. whereas in 1933 they delivered 5,135 or 9.1 of the total births.

In some communities midwives delivered a considerable percentage of the total births; for instance:

Carteret	57%	Garfield	39%
South River	48%	Perth Amboy	37%

In one large industrial city in which is located a large maternity hospital, the percentage of cases delivered by midwives was 7 per cent.

The following, giving total births and those delivered by midwives shows the trend for the past fifteen years, since the organization of the Bureau.

Year	Total Births	Births Delivered by Midwives	Percentage of Births Delivered by Midwives
1918	70,935	30,000	42.2
1923	76,530	17,645	23.
1928	68,297	11,352	16.6
1933	56,072	5,135	9.1

Following shows counties where midwives delivered more than 10 per cent. of the births:

County	Total Births	Births Delivered by Midwives	Percentage of Births Delivered by Midwives
Bergen	4,843	517	10.
Union	4,357	592	13.6
Passaic	4,020	614	15.
Somerset	971	194	20.
Middlesex	2,880	708	24.8

Following shows cities where midwives delivered more than 10 per cent. of the births:

City	Total Births	Births Delivered by Midwives	Percentage of Births Delivered by Midwives
Camden	1,737	197	11.
Newark	6,517	716	11.
West New York	474	63	13.
Belleville	402	58	14.
Clifton	653	98	15.
Bayonne	1,168	195	16.
Passaic	691	118	17.
Long Branch	264	47	17.8
Paterson	1,889	344	18.
Linden	375	76	20.
Cliffside Park	203	42	21.
Hoboken	724	162	22.
Lodi	216	56	26.
Elizabeth	1,611	421	26.
Perth Amboy	526	196	37.
Garfield	451	177	39.
South River	164	79	48.
Carteret	137	78	57.

SUPERVISION

During the year the nine midwives' county associations continued to hold interesting meetings. There were 95 meetings with an attendance of 1,557. In addition, the tenth annual conference was held in Newark with an attendance of 225.

The subjects of lectures and discussions during the year at the meetings were the Emergency Relief Problems, Proper Care of the Eyes of the New-Born, Nutrition in Relation to Child-Birth and Accidents in Pregnancies.

Because of decreased activities among midwives, it was found possible to make more special investigations of their work. The supervisors attended 43 deliveries and early postpartum cases with midwives.

PRENATAL CASES

There was an increase of 15 per cent. of prenatal cases reported by midwives. Midwives under supervision of the Department of Health referred 2,343 or 48 per cent. of the total cases delivered by them for prenatal care.

ABNORMAL CASES

The supervised midwives reported 369 or 7 per cent. of the total cases delivered by them as abnormal. Of these in 324 instances doctors were called in; in 16 instances patients were sent to the hospitals and in 29 instances no doctor was called; thus, in 92 per cent. of the abnormal cases reported by them, the patients were attended by doctors. The 29 cases where no doctors were called represent precipitate deliveries, twins, lacerations, inverted nipples and difficulty in nursing.

MATERNAL MORTALITY

In 1933 the total number of maternal deaths was 286 whereas in 1932 it was 352, making a decrease of 66 deaths. There is a decrease of 5,143 total births. After careful investigation, it was found that midwives were in attendance at sometime during

pregnancy, labor or lying-in on 11 of the maternal deaths. Thus, they attended 9.1 of the total live births and 3.8 of the maternal deaths.

SPECIAL INVESTIGATIONS

Special investigations were made to determine whether or not midwives were responsible for the abnormal conditions in the following 25 cases:

Puerperal death	10	Stillbirth	6
Infant death	5	Ophthalmia neonatorum	2
Sepsis	2		

No evidence was found that would warrant prosecuting the midwives for neglect or incompetence.

During the year 1933 midwives reported five cases of congenital deformities immediately after the birth of the babies to the State Crippled Children Commission.

EMERGENCY RELIEF

During the year definite arrangements were made by the State Emergency Relief Administration to have licensed, supervised midwives care for patients who desired midwives and who had had midwives at previous deliveries at a fee of \$10.00 per case. Details of the plan were worked out through the State Emergency Relief with the County Emergency Relief directors.

It has resulted in many instances in keeping midwives self-supporting whereas they might have been without any work at all and dependant on their families or possibly the Emergency Relief Administration.

There has been splendid co-operation from the Emergency Relief centers and many midwives are grateful for their help.

PROSECUTIONS

Five cases against midwives were heard by the State Board of Medical Examiners with the following result:

- Licenses revoked for practice of criminal abortion 2
- Reprimand for failure to call doctor on abnormal case 1
- Case pending for practice of medicine without license 1
- Case pending for practice of midwifery without license ... 1

MATERNITY HOMES

During the year 1933 there were 29 applicants for license to conduct maternity homes with the following results:

- Number new maternity homes licensed 2
- Number maternity homes relicensed 26
- Number maternity homes rejected for license 1

It has always been the purpose of the Department to restrict these homes to the care of a small number of cases. Excepting two homes, they have been licensed to care for one to four patients. In the two instances where maternity homes are conducted by well qualified graduate nurses, they have been licensed to care for eleven and fifteen patients.

Licensed maternity homes were conducted as follows:

- By graduate nurses 5
- By practical nurses 20
- By licensed, supervised midwives 3

The total number of cases cared for in the above maternity homes during 1933 was 297. Of these cases none resulted in maternal deaths. There was one infant death and three stillbirths. In each instance, these cases were investigated.

Warren (1 twinn)
Totals	1,272	80	4	705	120	433	444	49	71	628	845	427	

Of the 1,267 putative fathers, whose addresses were given, 67 were from out of State.

Of the 1,267 mothers, 11 were out of State residents.

Of the 126 born in Mercer County, 83 mothers were non-residents of the county.

Of the 20 born in Hunterdon County, 9 were non-residents of the county.

These statistics represent the illegitimate births to more non-resident mothers in proportion to births than other counties due to cases at the State Home for Girls at Trenton and the Clinton Farms in Hunterdon County.

Report of the Bureau of Venereal Disease Control

For the Year Ending June 30, 1934

ARTHUR JAY CASSELMAN, M.D., DR. P. H., CONSULTANT

In the annual report for the preceding year attention was directed to the importance of the new law in relation to venereal disease control. It has now been in force for over a year and has justified all the expectations held out for it. Physicians no longer have to be tied down to an outmoded definition of infectiousness, but are free to consider clinical symptoms and other tests in forming diagnoses of the infectiousness of syphilis and gonorrhoea. Health officers have very definite assurance that the law is behind them when they designate limits of isolation for sufferers from gonorrhoea and syphilis. The physician and the local health executive together bear the brunt of the remedial side of the control of venereal disease and the new law supports them in their efforts. It has, in fact, received commendation from venereal disease control officials in other states.

Some statistics mean little, and others are difficult to interpret as a gauge of efficiency in the control of the venereal diseases. To illustrate, one source of infection may be a prostitute who has infected a dozen men with syphilis, and the next may be a mother who, after acquiring syphilis from her husband, has passed it on to her child. One lecture may be given to a thousand young men in a C.C.C. camp and one may be given to a small audience of elderly ladies. Each case statistically counts for a unit but the units have different values.

The statistics are given, but the reader must be careful in his interpretation. A decrease in reported cases of venereal disease might not mean a decreased prevalence. An increase might mean only increased activity of the Bureau in stimulating physicians to report all their cases.

CASES REPORTED

Number of cases of venereal disease reported to the State Department of Health, for the twelve months ending June 30, 1931, 1932, 1933 and 1934:

	1931	1932	1933	1934
Chancroid	57	54	39	79
Gonorrhoea	4,175	4,088	3,734	3,272
Syphilis	7,591	7,911	7,007	7,125
Total	11,823	12,053	10,780	10,476

The table below gives the reported cases in New Jersey by county, disease and sex for the calendar year of 1933, together with the yearly rate per thousand:

County	Gonorrhoea		Syphilis		Chancroid		Total	Popu- lation	Rate Per M
	M	F	M	F	M	F			
Atlantic	304	41	301	348	0	0	994	137,794	7.214

* Does not include cases from Hudson County Laboratory.

This is a falling off as compared with the preceding year when 11,110 cases were reported. This cannot, however, be regarded as an accurate picture of the prevalence of venereal disease in New Jersey. So long as the cases of gonorrhoea are only about half the number of cases of syphilis, instead of over four times as many, no dependence at all can be placed upon the gonorrhoea figure. The syphilis cases are far more apt to be accurate and are practically the same as for the year 1932.

CLINIC PATIENTS AND TREATMENTS FOR FISCAL YEARS
1931, 1932, 1933 AND 1934

	1931	1932	1933	1934
<i>Patients</i>				
Syphilis	4,153	4,309	4,810	4,663
Gonorrhoea	2,242	2,383	2,638	2,381
Total	6,395	6,782	7,448	7,044
<i>Treatments</i>				
Syphilis	108,887	161,231	187,654	202,528
Gonorrhoea	27,109	35,841	49,460	41,542
Total	135,996	197,072	237,114	244,070

The proportion of clinic patients to private patients is essentially the same as in the preceding fiscal year. Then out of every hundred 67 patients reported were from the clinics and 33 under the care of private practitioners. For the fiscal year 1934 just completed, out of 1,000 patients 678 attended clinics and 322 were receiving private treatment. It will be extremely interesting to note if the same ratio holds out during the coming year.

ANALYSIS OF SOURCES OF INFECTION

The following table classifies the sources of infection that were reported to the State Department of Health for the fiscal years ending June 30, 1932, 1933 and 1934:

	1932	1933	1934
Professional prostitutes and brothels ..	40	22	35
Clandestine prostitutes	229	222	245
Husband or wife	185	170	207
Congenital	136	376	344
Miscellaneous	7	5
Total	590	797	836

ACTION TAKEN ON SUSPECTED SOURCES OF INFECTION

During the past fiscal year 226 cases of persons reported as being the probable sources of infection have been referred to local health executives for investigation. This is an increase of 21 over the preceding year and five less than for the year ending 1932.

	1932	1933	1934
Under supervised medical treatment	61	59	59
Unable to locate the person named	55	42	51
Examined but found presumably non-infectious	43	34	48
Other acceptable disposition (agreed to take treatment, etc.)	11	23	21
Disposition unknown, or unsatisfactory (evaded supervision by moving, etc.)	7	3	7
Referred to health officials in other states	33	25	24
Handled by police authorities	7	3	3
No response from local health authorities	14	16	13
Total	231	205	226

It is not necessary to refer all suspected sources to the local health executive. In fact this is done only when no other course is possible. It will readily be understood that it is not desirable to report to the health officer a suspected source who is the husband or wife and who is living with the informing patient. This is a matter to be handled by the attending physician. Neither is it desirable to report the mother of a congenital syphilitic to the health officer. Here again the attending physician is the proper one to handle the case.

A case of gonorrhoea was reported, contracted from a prostitute in a "tavern". The health officer was interested, and he interested a police official. The "tavern" was investigated. The girl was well known but the proprietor averred she had not been around recently! The tavern had the appearance of being a "hot bed of prostitution". A short time later application was made for renewal of the liquor license, but—the report from the Bureau and the report of the police was presented. The license was revoked.

The spirit of co-operation extended by practically all local health executives in locating suspected sources is most commendable. Of the 226 cases it will be noted that only 13 elicited no response

from the local authority, 59 were placed under treatment, 21 agreed to take treatment, 48 were negative on the subsequent test. Many of these latter were women suspected of being infected with gonorrhoea. The laboratory examination is usually negative in cases of chronic gonorrhoea and these are the common sources of infection. Considering the tendency to give fictitious names and addresses to attending physicians, 51 is a comparatively low number of the cases that could not be located.

The Bureau again expresses its sense of obligation to the many health officers who have helped to make this enviable record, and to say again that the Bureau whenever possible is glad to make available the services of an expert investigator.

CHANGES IN CLINICS AND CO-OPERATING PHYSICIANS

During the past fiscal year new clinics have been opened in the North Hudson Hospital in Union City, and a county clinic for Atlantic County in Mays Landing. There are now thirty-five clinics.

Dr. James of Dover is no longer a co-operating physician, but Dr. J. P. Kuhl of Butler and Dr. Charles P. Bailey of Lakewood have been added to the list, so there are now thirty-seven in the State of New Jersey.

Parts of the State, especially in the rural sections, are not in close touch with clinic facilities, nor are there co-operating physicians nearby. To take care of this contingency the Bureau of Venereal Disease Control will supply the necessary drugs to any physician who enters into agreement, temporary or otherwise, to treat an indigent person suffering from gonorrhoea or syphilis in an infectious stage, but the fees for treatment must be arranged for locally. The medical consultant of this Bureau is always ready to give free consultant service to physicians who may find such service useful. In any case of a suit being brought against a physician for a practically unavoidable nearsphenamine or treatment calamity, the medical consultant will be glad to assist the defendant with expert testimony. The 1933 list of treatment facilities included the names of those physicians treating and reporting a minimum of three a year. The list of treatment

facilities including names of physicians treating private cases was received most favorably last year, upon its appearance in the summer of 1933. In all, three hundred qualified for this list of the more expert venereologists. Such a list should be issued biennially.

VENEREAL DISEASE WORKERS' CONFERENCE .

The value of occasional conferences of social workers engaged in venereal disease control work in New Jersey clinics is obvious. In December of 1931 the Bureau called such a conference in Elizabeth and for the convenience of social workers it was held in connection with the New Jersey State Conference of Social Workers, thus affording the opportunity to attend both conferences. It was so successful that it was decided to have conferences annually. In 1932 one was held at the State House in Trenton and in 1933 it took the form of a luncheon at the Berkeley-Carteret Hotel in Asbury Park, on Friday, December 8th. Although special invitations are sent to social workers of all venereal disease clinics, other persons are made welcome also and the topic chosen for the discussion is something closely related to the social workers' interest in the venereal diseases. A good attendance is thus easily assured, for the need for much of the work done by social workers is based upon the existence of the venereal diseases.

The question and answer form of discussion is also resorted to. The "link-up" with the State Conference is deemed most important. Usually the conference will be a luncheon at a time affording opportunity for one to attend without missing any other important feature of the State meeting.

PUBLIC HEALTH COURSE

As is customary the chief of the Bureau gave two lectures on the venereal diseases to the senior class of the public health course at Rutgers. The first lecture dealt with the duties of a health officer with reference to handling cases and suspected cases of gonorrhoea and syphilis. His second lecture was devoted to the educational side of the control work, and which is a large feature of the Bureau's activities.

TREATMENT

The Bureau continues to recommend and supply the most practical drugs for treatment: neoarsphenamine and bismuth subsalicylate. Neoarsphenamine has always been supplied rather than old arsphenamine because it is simpler to give and its advantages outweigh any possible greater efficacy of the older drug which most physicians find impracticable for them to prepare and give, because of the complicated technique. Bismuth subsalicylate in oil has always been favored by this Bureau because it is practically painless, unlike the majority of other bismuth compounds. Many bismuth compounds are advertised as painless, but the physician usually finds this claim to be untrue. We now require all bismuth purchased to be made up to our own formula to contain 0.2 gm. metallic bismuth per c.c. This is the quantity, 0.2 gm. metallic bismuth, which fits the usual weekly administration. Twenty cubic centimeters, containing 4 gm. metallic bismuth in the form of bismuth subsalicylate, furnishes sufficient bismuth for the usual adult for a year of treatment. Mercury has not been supplied for some years, because it is painful and less efficacious than bismuth. Bismuth does all that mercury can do, and quite a bit more. Iodides are advised by the Bureau in all stages of syphilis, but are not supplied because of their bulk and their relative cheapness as compared with the other drugs.

To make an equitable distribution of our limited supplies of drugs is always a problem. The Emergency Relief Commission does not sanction the supplying of drugs or the paying of a physician's fee in a case of venereal disease. Yet there is nothing so important to the health of a community as that an infectious case should be made non-infectious as rapidly as possible. The problem of the indigent, infectious patient on relief was met not by the E. R. A., but by this Bureau, by supplying neoarsphenamine and bismuth subsalicylate to physicians treating such patients. Drugs are supplied to physicians if the physician does not receive for his treatment more than \$2.00 per week or per visit. The Bureau does not guarantee the physician's fee, but sometimes the local health department pays the physician in indigent cases.

The past few years have severely taxed the resources of many of the venereal disease clinics, and they gladly received emergency supplies of neosarsphenamine and bismuth and minor equipment. It is uncertain how long the Bureau may be able to extend this help, for it is in turn governed by budgetary limitations imposed by the Legislature. Nevertheless there must be no uncertainty in the prompt supplying of drugs which will render a sufferer non-infectious when it is in any way possible.

In accordance with our custom we have supplied 282 physicians with neosarsphenamine and bismuth subsalicylate free for reporting the names and addresses of the probable sources of syphilitic infections. From January 1, 1934, to June 30, 1934, supplies were sent to 212 physicians who were treating indigent, infectious patients suffering from gonorrhea or syphilis. These physicians were treating patients for a maximum fee of \$2.00 per treatment or per week. The payment of this fee was entirely a matter between the physician and the patient or the local health authorities. No fees to physicians are paid by this Bureau.

C.C.C.

The Federal Government selected Camp Dix as the receiving station to which all C.C.C. applicants in the 2nd Corps Area should be sent for conditioning. These fifty thousand young men are certain to create a venereal disease problem.

There has been the utmost co-operation between the Bureau and Camp Dix in seeking to control venereal disease perils. The Commanding General has been insistent that everyone enrolled into the C.C.C. at Camp Dix hear a lecture on venereal diseases given by the Supervisor of Social Hygiene Education. The lecturer is most successful, being able to speak the same language as his hearers, and questions without end are promptly and emphatically answered. Throughout the speaker's lectures runs his insistent note that anyone believing himself to be infected should go immediately to the best physician available and put himself absolutely under the doctor's orders. At present anyone acquiring a venereal disease while in the service of the C.C.C. is treated until non-infectious, when he is discharged.

Formerly one acquiring a venereal disease was discharged at the camp where he was stationed, and notice of the action was sent to the Department of Health of the state wherein the man resided.

Under this regulation this Bureau received notice of the discharge of 77 men for having acquired a venereal disease. The information was duly passed on to the local health executive of the community where the man resided with a request to investigate if the man should return home as he usually did. Fifty-three were placed under treatment by the local health officer. Six could not be located; and in 13 cases no reply was received from the local health officer, in most cases due to inability to locate the man. Three men upon second examination were found to be negative, and two had chancroid and were not followed up. This co-operation between the Federal Government and the State Department of Health was certainly whole-hearted and produced real results.

Now the C.C.C. regulation has been changed and if one contracts a venereal disease while stationed in the Second Corps Area he is sent to the hospital at Camp Dix for treatment until non-infectious when he is discharged.

INVESTIGATION

The investigational work has been highly successful. Rural and small town health executives are entirely at sea with regard to handling the case of an infected prostitute and are inclined to push it to one side as a police case. The Bureau looks at the matter purely from the health angle and intends to have the offender receive treatment rather than legal punishment. When the perplexed health officer calls on the Bureau for assistance the investigator interviews the girl and when she realizes that health is the prime factor she talks freely, usually involving herself. It is very easy when this step has been reached to persuade her to plead guilty to prostitution, waive a Grand Jury hearing so she may be sent at once on an indeterminate sentence to Clinton Farms, where excellent treatment will be given to her, and in fact, a new world opened to her. Within the last fiscal year five girls have thus been sent to Clinton and all are now under treatment.

So far all the girls have been old enough to be committed to Clinton.

EDUCATIONAL

The largest number of addresses during the past fiscal year have been given to the C.C.C., and all but three of these were at Camp Dix; 123 lectures covering 35,000 men. The Commanding General has been unstinted in his praise of the lectures, and has asked to have them given to the regular army men as well as in the C.M.T.C. The innovation started two years ago of offering a series of lectures to student nurses has been continued, as there was an openly manifested desire on the part of the hospital authorities for the nurses to obtain the public health point of view of gonorrhoea and syphilis, as well as the medical. The parent-teacher associations extended many invitations to have addresses given to them and the men's civic clubs, also in large numbers, asked for more talks on social hygiene. Four new high schools were added to the number having the sex hygiene lectures to girls and boys separately.

The Bureau has distributed free pamphlets on sex education issued by the Federal Government. However, the one for adolescent girls was very inferior and used almost under protest. The representative of the Bureau who gives the lectures to adolescent girls and to mothers prepared a book for girls in their teens called "To Womanhood" giving the Bureau the privilege of using it. It has met with much satisfaction. The first edition of 10,000 has been exhausted and a second edition is now in course of distribution. Two states asked the privilege of using it for their own growing girls.

Teaching sex hygiene in the school has always been a sincerely controversial subject, but whether one believes in it or not one thing is certain: there is a demand that teachers be well-grounded in the elements of sex education, equipped to handle such problems as might be thrust upon them. To that end the Bureau has stimulated and fostered the installation of an extension course in Newark by New York University where those successfully completing the course were allowed two credits toward a degree. A similar course in Camden, accredited by the Temple University of Philadelphia, has the Bureau's endorsement. It is expected that these two courses will be offered each year.

MEETINGS HELD EACH MONTH, WITH THE TOTAL ATTENDANCE FOR THE MONTH, AND THE TYPE OF ATTENDANCE AT THE MEETINGS

1934	482	66,427	24,441
	5,109	602,339	1,099,189

RECOMMENDATION

Some classes of patients suffering from gonorrhea or syphilis are no trouble at all to the health official; for example, intelligent men who have the means will place themselves under the care of a physician and follow all instructions implicitly. Those who are confined in penal institutions or State hospitals are required to take treatment. Those who are in touch with clinics are cared for but there are others who because they have neither money nor criminal records are at a disadvantage, e.g. the child of needy parents with congenital syphilis, the indiscreet girl not a professional prostitute, the man or woman without funds, who wants treatment, but owing to removals has not acquired a definite residence in New Jersey. These are the ones who need treatment facilities. The Bureau does not advocate building a new expensive State hospital, but it does believe that State, county, and municipal institutions with an abundance of physicians, nurses and treatment facilities should be opened, in so far as possible, to patients who cannot obtain treatment elsewhere.

Report of the Bureau of Public Health Education

For the Year Ending June 30, 1934

EDWIN C. LANIGAN, CHIEF

Educational activities of the Department centered in this Bureau during the past fiscal year. They consisted of dissemination of information through the medium of the public press, magazines and exhibits. Again the press of the State was responsive to material furnished by the Bureau and health topics were discussed in the magazine of the New Jersey League of Municipalities and the Journal of the Medical Society.

Resumption of the Public Health News in July of 1933 was due to the appropriation of funds by the Legislature on recommendation of the survey of the State government by Princeton University.

Emphasis was placed during the year by the Bureau upon the Department's activities, its legislative program and subjects pertaining to the public health, urging the public to consult physicians for treatment of maladies.

Public health education was championed by His Excellency, Governor A. Harry Moore in his annual message to the 1934 Legislature. The message contrasted New Jersey's expenditures for custodial care—to correct health and dependency conditions which ought never to have occurred—with important work accomplished by the State Department of Health in maintaining health standards. The Executive message advocated substitution of preventative health programs for institutional care and cure.

More general health education was the antidote prescribed; insisting there should be more and better health work; a more determined attack upon disease, insanitation and unwholesome

social conditions; invoking aggressive preventative measures to the greatest extent to reduce custodial care.

New Jersey's interest in the Public Works Administration recovery program was emphasized at the meeting of the New Jersey Health and Sanitary Association in Atlantic City, November 24, 1933. Dr. J. Lynn Mahaffey, director, stressed the proposed \$40,000,000 municipal sanitation improvement program, prepared by the State Department of Health, for new and additions to existing sewage and water treatment plants in New Jersey. Reaction to the Department's program was favorable, gaining comment of national administration officials for completeness of its data for Federal aid for New Jersey municipalities.

Informational material was distributed by the Bureau in support of the legislative bills for State regulation of public swimming pools and baths, better supervision of the shellfish industry, enforcement of the pure food and drug laws for detection of adulteration and misbranding of beverages legalized by repeal of the Eighteenth Amendment, and proposed pensions for indigent typhoid fever carriers.

The Bureau completed the first year's enforcement of the Barber License Law of 1933. Enrollment of barbers under the law progressed during the year. In the first year of operation 8,536 registered barbers were licensed; 2,081 temporary permits pending examination were granted and 686 apprentices licensed. Examinations were held by the examiners in every county of the State.

Receipts of the Bureau from licensing of barbers for the fiscal year were \$64,731.10 and administrative expenses \$20,000 fixed by statute. The balance was turned over to the State Treasury.

The statute provides for the appointment of three examiners, according to Chapter 175 of the Laws of 1933. Civil service inspectors served during part of the year.

A sincere effort was made by the Bureau to enforce the rules and regulations of the Department respecting the sanitation of shops subject to the law.

Report of the Bureau of Vital Statistics

For the Calendar Year 1933

DAVID S. SOUTH, STATE REGISTRAR

The Bureau, which was established in 1878, has the custody of more than seven million records of births, marriages and deaths which date back to 1848. In 1933 more than 11,000 searches were made and copies of the records found issued, for which \$6,759 were received and paid to the State Treasurer. Approximately 4,000 of the copies were issued to widows, veterans and veterans' organizations for compensation and other pension purposes; for children to enter school or procure employment; for enlistment in the Army or Navy of the United States, for all of which purposes no charge is made.

The registration of births, marriages and deaths was supervised in each city, borough and township of the State. Blanks for birth, marriage and death certificates, burial and transit permits and other forms were supplied by the Bureau as required by law.

During the year 1933, the Bureau received, examined, classified, indexed and permanently filed more than 130,000 certificates of births, marriages and deaths, part of which records were for unreported events which occurred in past years. The annual growth of the records requires approximately two hundred cubic feet of storage space.

Persistent efforts to obtain suitable basement storage for the records were successful. The Bureau was assigned seven basement rooms having ample room for the records to be arranged in good order and with allowance for twenty years of growth. Sufficient light and air is available for the three full time vault workers and the many persons who consult the records daily.

The Bureau compiled an increased amount of special statistical data, for the use of insurance companies, chambers of commerce, students, statisticians and agencies interested in disease and accident prevention.

GENERAL SUMMARY

	1920	1930	1933
Births registered, tabulated and indexed	76,431	68,282	56,072
Marriages registered, tabulated and indexed ..	31,327	28,499	24,453
Deaths registered, tabulated and indexed	40,820	43,190	43,380
Stillbirths registered, tabulated and indexed ..	3,221	2,647	2,073
<hr/>			
Total records registered, tabulated and permanently filed	151,799	142,618	125,978
<hr/>			
Searches made and certified copies issued for which fees were received	4,664	10,523	7,751
Certified copies issued and searches made in pension and other cases for which no fees were received	4,232	6,938	4,009
Fees returned to State Treasurer for searches and certified copies	\$4,051	\$9,601	\$6,759

Table 22. Deaths by causes, sex, color and age periods in the counties and cities having 10,000 or more inhabitants in 1930. (County figures include cities which follow):

Atlantic County— Atlantic City	Essex County (con.)— Nutley Orange	Morris County— Dover Morristown
Bergen County— Englewood Garfield Hackensack Rutherford	South Orange West Orange	Ocean County—
Burlington County— Burlington City	Gloucester County— Hudson County— Bayonne Harrison Hoboken	Passaic County— Clifton Passaic City Paterson
Camden County— Camden City Gloucester	Jersey City Kearny Union City West New York	Salem County— Somerset County—
Cape May County—	Hunterdon County—	Sussex County—
Cumberland County— Bridgeton Millville	Mercer County— Trenton	Union County— Elizabeth Linden Plainfield Rahway Summit Westfield
Essex County— Belleville Bloomfield East Orange Irvington Montclair Newark	Middlesex County— New Brunswick Perth Amboy	Warren County— Phillipsburg
	Monmouth County— Asbury Park Long Branch Red Bank	

Population—The estimated mid-year population of the State for 1933 was 4,322,082. These figures were obtained by the arithmetical method, using the United States census figures for 1920 and 1930. The estimated population of the counties and incorporated municipalities of the State having 10,000 or more inhabitants in 1930 appears at the foot of the mortality tables for the places.

Births—The number of births for 1933 was 56,072 which was equivalent to a rate of 12.9 per 1,000 population, which was the lowest birth rate recorded. Total births reported decreased more than 5,000 from the number for the previous year. The low

figure for 1933 is a continuance of the decline in evidence since 1917 when the rate was 24.9.

Marriages—The number of persons married during 1933, per thousand of population, was 11.3. The rate showed a slight improvement over the 1932 figure of 10.7, which rate was the lowest since marriage statistics were first compiled in 1879. The ease and rapidity with which marriage licenses can be secured in certain adjacent States materially affect the New Jersey rate. Economic conditions were also a considerable factor and were undoubtedly partly responsible for the gradual decline which has occurred in the marriage rate during the past ten years. The number of marriages by months follow:

NEW JERSEY, 1933			
January	1,444	August	1,977
February	1,602	September	2,941
March	1,097	October	2,504
April	1,761	November	2,385
May	1,516	December	1,953
June	3,106		
July	2,167	Total	24,453

Deaths—The number of deaths for 1933 was 43,380. The death rate, 10.0 for the year, was the lowest rate since the State Department of Health was established fifty-six years ago. The previous low rate was 10.1 for 1932.

TABLE 1.—POPULATION; BIRTHS, MARRIAGES AND DEATHS REPORTED WITH RATES PER 1,000 POPULATION

YEAR	Estimated Population	BIRTHS		MARRIAGES		DEATHS	
		Number of births reported	Birth rate per 1,000 population	Number of marriages	Previous married per 1,000 population	Number of deaths	Death rate per 1,000 population

CHART 1.—TOTAL DEATHS PER 1,000 POPULATION FOR 55 YEARS

Infant Mortality—The infant mortality rate for 1933 was 46.5 per 1,000 babies born alive. This was the lowest infant mortality rate attained in New Jersey. The previous low rate was 50.4 for 1932. The rate for 1931 was 56.9. Reference to Table 4 will show the great decrease in the infant death rate in New Jersey since extensive baby welfare work was undertaken.

Colored Races—The infant mortality rate for the colored races was 76.7. The colored races have shown high mortality rates since vital statistics were first collected and analyzed.

Maternal Mortality—This rate for 1933 was 5.1 and for 1932, 5.7. It is regrettable that a decrease comparable to the infant mortality decline has not been shown in deaths due to maternity. The colored maternal mortality rate was 6.3.

Stillbirths—The number of stillbirths reported for 1933 was 2,073. The number for the previous year was 2,343. The 1933 rate was 36.9 per 1,000 live births. The rate for the colored population was 59.1.

TABLE 3—NUMBER OF DEATHS AT ALL AGES, UNDER ONE YEAR OF AGE AND UNDER FIVE YEARS OF AGE, AND THEIR PERCENTAGES OF TOTAL DEATHS

Typhoid Fever—The death rate for this disease (including paratyphoid) for 1933 was only 0.09 per 10,000 population. That the rate was low was proven by the 1932 rate of 0.37 for the United States Registration Area. The rate for the Registration Area for 1933 was not available. The number of deaths from typhoid fever and other diseases of the international list of causes of death by counties and cities can be obtained by referring to Table 20. Table 22 shows the more important causes by sex, color and age groups.

TABLE 8—COMPARATIVE DEATH RATES FROM TYPHOID FEVER PER 10,000 INHABITANTS, IN THE REGISTRATION AREA OF U. S. AND IN N. J. FOR 10 YEARS

1889	203	1902	36	1916	10	1930	5
1890	195	1903	40	1917	5	1931	0
1891	180	1904	47	1918	13	1932	3
		1905	21	1919	2	1933	1

Smallpox—No deaths from smallpox occurred in New Jersey during 1926, 1927, 1928, 1929, 1930, 1931, 1932 and 1933. During the two years previous to 1926 deaths occurred as the disease was prevalent in epidemic form in certain sections of the State.

Measles—This disease was responsible for 71 deaths in 1933. During the preceding year 41 deaths occurred. In 1929 there were only 33 deaths from measles.

Scarlet Fever—The number of deaths from scarlet fever was 59. Very little variation has occurred in the death rate from this disease for the past ten years. The average rate for the period was about one-half the rate which prevailed during the previous decade.

CHART 4—DEATHS FROM SCARLET FEVER PER 10,000 POPULATION FOR 55 YEARS

Whooping Cough—This disease caused 43 deaths during 1933, for 1932 the number was 123 and for 1931, 136.

Diphtheria—During 1933 only 52 persons died from diphtheria and laryngeal croup, equivalent to a rate of 0.12 per 10,000 population, compared with 0.22 for the previous year and 0.29 for 1931. The death rate from diphtheria for 1888 was 14.8 per 10,000 population. During the decade beginning with 1900 the rate declined from 4.8 to 2.5. The following ten-year period showed a decline to 1.8. The rate for 1933 was the lowest recorded.

CHART 5—DEATHS FROM DIPHTHERIA PER 10,000 POPULATION FOR 55 YEARS

Tuberculosis—The number of deaths from all forms of tuberculosis during 1933 was 2,376. The number of deaths from tuberculosis of the respiratory system was 2,165. The death rates per 10,000 population were 5.49 and 5.00 respectively. These were the lowest tuberculosis death rates recorded in New Jersey.

TABLE II.—AVERAGE ANNUAL DEATH RATES FROM ALL CAUSES AND FROM TUBERCULOSIS OF LUNGS, PER 10,000 POPULATION, FOR 55 YEARS, COMPARED WITH RATES FOR 1933

COUNTIES	Average annual death rates from all causes	Death rates from all causes, 1933	*Average annual death rates from tuberculosis of lungs	*Death rates from tuberculosis of lungs, 1933

The State	145	100	13.9	4.6

* It should be noted that these rates are for tuberculosis of the respiratory system. Rates of all forms of tuberculosis appear among the tables of the Bureau of Local Health Administration.

CHART 6—DEATHS FROM TUBERCULOSIS OF LUNGS PER 10,000 POPULATION FOR 55 YEARS

CHART 7—DEATHS FROM CANCER PER 10,000 POPULATION FOR 55 YEARS

Encephalitis Lethargica or Sleeping Sickness—Thirty-six deaths were assigned to this affection for the year 1933. In 1922, which was the first year that the disease was separately classified, there were forty-five deaths, while for 1932, 35 deaths were recorded.

Nephritis—Deaths due to acute and chronic nephritis totaled 3,601, compared with 3,865 for the previous year.

Suicide—Deaths by this means increased considerably during the years 1927 to 1933. Of the various means employed poisonous gas was responsible for the most deaths, with firearms and hanging in second and third places. The number of deaths by suicide for seven years follows:

1927	505	1930	601
1928	565	1931	694
1929	622	1932	740
	1933	709	

AUTOMOBILE FATALITIES

Deaths due to accidents in which automobiles were involved totaled 1,207 compared with 1,158 for 1932. The figures include 22 deaths due to motorcycle accidents, 21 deaths of bicyclists who were struck by automobiles and 27 accidental deaths due to the inhalation of motor exhaust.

Analyzed the motor fatality data show the death of 623 pedestrians, which number is equivalent to 51 per cent of the total. More than one-fourth of the pedestrians who died were children under fifteen years of age. Seventeen per cent of the drivers and occupants of automobiles who were killed were less than twenty years of age.

The following table shows deaths, in New Jersey, of both residents and non-residents of the State, arranged by age groups:

MOTOR VEHICLE FATALITIES BY AGE PERIODS, 1933

Age	Pedestrians Struck by Motor Vehicles		Deaths From Other Motor Vehicle Accidents		Totals	
	Non- Residents	Residents	Non- Residents	Residents	Non- Residents	Residents
