Vital events which occurred in 1964 -- births, marriages, and deaths -- and other significant public health statistics are presented here as a separate document.

The narrative presentation of activities of the New Jersey State Department of Health in 1964 is published separately.

Some persons, such as specialists in community planning, have primary need for the statistical data only. Separate publication of the two documents provides opportunity for somewhat more flexibility in meeting the specific needs of interested persons.

Report of the Public Health Statistics Program
Calendar Year, 1964

New Jersey's vital statistics for 1964 show that fewer births occurred to its residents, that more marriages occurred in 1964 than in 1963, that resident deaths showed a numerical increase over the preceding year and that the number of resident infant deaths was slightly lower than in 1963.

POPULATION: For purposes of computing rates the State's population was estimated to be 6,590,000 as of July 1, 1964. The estimate is based on the assumption that the average yearly change between April 1, 1950 and April 1, 1960 census continued to 1964.

Population growth is dependent on net migration (excess of in-migration over out-migration) and natural increase (excess of births over deaths). While the extent of in and out migration is difficult to determine, figures showing the natural increase since 1960 follow.

<u>Year</u>	<u>Births</u>	<u>Deaths</u>	<u>Natural Increase</u>
1960	132,594	59,330	73,264
1961	135,320	60,814	74,506
1962	131,603	61,967	69,636
1963	132,606	63,797	68,809
1964	131,593	63,963	67,630

It may well be that the July 1, 1964 population estimates for the State, counties and major cities are overstated in some instances and understated in others. Rates based on these estimates, therefore, should be used with caution.

VITAL EVENTS IN NEW JERSEY: Of interest is the following table showing the number of births, marriages and deaths which occurred in New Jersey during each of the twelve months.

<u>Month</u>	<u>Births</u>	<u>Marriages</u>	<u>Deaths</u>
Total	127,963	45,632	62,546
January	10,493	2,616	5,816
February	10,122	3,431	5,044

July	11,509	3,397	5,189
August	11,103	4,790	4,965
September	11,181	4,411	4,683
October	10,973	4,233	5,191
November	9,967	3,613	5,172
December	10,442	2,816	5,829

BIRTHS OCCURRING IN NEW JERSEY: Most of the births occurring in New Jersey were delivered in hospitals. Of the 127,963 live births 99.5 percent (127,286 babies) were born in hospitals. Physicians attended the births of 486 infants in places other than hospitals and midwives delivered 11 babies.

Multiple births numbered 2,671 or 2.1 percent of total births in New Jersey. There were 2,600 children who were twins and 71 were triplets. While slightly fewer twins were born in 1964, the number of triplets almost doubled. There were 36 triplets born in New Jersey in 1963. Male babies numbered 65,735 while female babies totalled 62,226. Sex was unstated on two birth certificates.

RESIDENT BIRTHS: There were 131,593 resident births in 1964 as compared with 132,606 in 1963. The birth rate dipped from 20.5 to 20.0 per 1,000 population in 1964. New Jersey's birth rate has been declining as has the birth rate for the nation as a whole. In 1964 the State's birth rate was lower than that of 21.0 reported for the United States.

Ten percent (13,222) of the total births occurred to teen-age mothers. A third of the births occurred to mothers 20-24 years of age.

Births out-of-wedlock increased by 10 percent in 1964 and totalled 7,180 births as against 6,502 in the preceding year. In 1950 illegitimate births accounted for 2.3 percent of the total births. By 1960 this percentage rose to 3.6 and, in 1964, illegitimate births comprised 5.5 percent of the total.

Most of the infants born to mothers 10-14 years of age were illegitimate. Of the 191 live babies born to mothers in this age group, 173 were born out-of-wedlock. In 1963 there were 164 illegitimate births out of a total of 189 born to mothers 10-14 years old. Slightly more than 22 percent of the 13,031 infants born in 1964 to mothers 15-19 years old were born out-of-wedlock. Comparable figures for 1963 were 21 percent out of a total of 12,531 babies.

Weights of infants born to New Jersey mothers and the percent of resident births in each age group are given in the table following. Since 1,756 birth certificates did not show the weight of the child, these are excluded from the table. Percents, therefore, were computed on a total of 129,837 resident births for which weights were stated.

<u>Weight Group</u>	<u>Number</u>	<u>Percent</u>
5001 grams or more	181	0.1
4501-5000 grams	1,426	1.1
4001-4500 grams	8,713	6.7
3501-4000 grams	32,851	25.3
3001-3500 grams	50,178	38.6
2501-3001 grams	25,914	20.0
2001-2500 grams	7,029	5.4
1501-2000 grams	1,884	1.5
1001-1500 grams	827	0.6
<u>1000 grams or less</u>	<u>834</u>	<u>0.6</u>
Total with weight given	129,837	99.9

Babies weighing 2500 grams or less are referred to as immature births. These numbered 10,574 and represented 8.1 percent of all live births for which birth weight was known. Included in the total of immature births are 1,141 infants who were born out-of-wedlock.

MARRIAGES: A continued rise in the number of marriages was evident for the sixth consecutive year. In 1964 a total of 45,632 marriages were performed while 43,353 marriages took place in the preceding year. Marriage rates per 1,000 population were 6.9 and 6.7 respectively.

The peak month for marriages was June, as would be expected, and the month of August was a close second. The least number of marriages occurred in March. With the exception of June, September, November and December, all other months showed an increase in marriages over the same months in 1963.

More teen-agers became brides and grooms in 1964. There were 12,210 brides and 3,377 grooms under age 20, with those aged 18 and 19 predominating. While 37 females who married were under age 15, the earliest age at marriage for males was 15 years. At age 15 there were three grooms and 206 brides. Most brides and grooms were in the age group 20-24. Among those married were 127 females and 395 males 70 years old or over.

Approximately 83 percent of those who married did so for the first time. Among the remaining brides and grooms, there were 2,570 widows, 2,583 widowers, 4,827 divorcees and 5,055 divorced men.

DEATHS: There were 63,963 resident deaths yielding a death rate of 9.7 per 1,000 population. Although deaths from all causes in 1964 were higher than the 63,797 deaths recorded in 1963, the overall death rate was slightly lower than the rate of 9.9 for 1963. New Jersey's death rate was above the 1964 provisional rate of 9.4 per 1,000 population for the United States.

A total of 7,297 veterans died in New Jersey. Among these were 4,659 persons who served in World War I, 2,069 who were World War II veterans, and 56 who served in both World Wars I and II. Fifty deaths were of veterans who were in the Spanish-American War and one who was in both the Spanish-American War and World War I. Veterans of the United Nations Forces accounted for 153 deaths, and 51 persons who died in 1964 served in wars which occurred prior to World War I. There were an additional 258 veterans whose death certificates indicated military service but did not specify the war in which they took part.

INFANT MORTALITY: Almost five percent of the total deaths were of infants less than one year old. In 1964 there were 3,118 deaths under one year of age with an infant mortality rate of 23.7 per 1,000 live births. Comparable figures for 1963 were 3,177 infant deaths and a rate of 24.0. For 1964 the infant mortality rate for the United States, was estimated to be 24.2 per 1,000 live births as against 25.2 in 1963.

Especially vulnerable are babies less than one day old. In 1964 forty-six percent or 1,429 infants failed to survive the first day of life. Of the 3,118 infants who died within the first year, 77 percent were less than 28 days old at the time of death. This latter group comprises neonatal deaths and numbered 2,396 deaths.

In 1964 the neonatal mortality rate was 18.2 per 1,000 live births and was the lowest recorded in the last ten-year period. The highest neonatal mortality rate in the last decade occurred in 1963 and amounted to 19.0 per 1,000 live births.

New Jersey in 1964, experienced a drop in both fetal deaths and in deaths of infants less than a week old. Consequently, its perinatal mortality showed a decrease. There were 4,317 perinatal deaths in 1964 and a rate of 32.3 per 1,000 total deliveries (live births and fetal deaths combined). In 1963 perinatal deaths numbered 4,523 and yielded a perinatal mortality rate of 33.5.

MATERNAL DEATHS: A total of 48 maternal deaths with a rate of 0.4 per 1,000 live births were recorded in 1964. Although the maternal mortality rate in 1963 was the same as in 1964, maternal deaths were slightly higher and numbered 50. In the past ten year period the maternal death rate ranged between 0.3 and 0.5.

FETAL DEATHS: Decreases in both the number of fetal deaths and the fetal death rate were also noted. Fetal deaths fell from 2,255 in 1963 to 2,136 in 1964 and the fetal death rate dropped from 17.0 to 16.2 per 1,000 live births.

LEADING CAUSES OF DEATH: The selected leading causes of death and the percent of total deaths for which each was responsible follow.

<u>Cause</u>	<u>Percent</u>
1. Diseases of the circulatory system	47.9
2. Malignant neoplasms	18.4
3. Vascular lesions affecting the central nervous system	8.7
4. Influenza, pneumonia and bronchitis	3.0
5. Diabetes	2.0
6. Motor vehicle accidents	1.7
7. Cirrhosis of liver	1.7

As a group these diseases account for 83 percent of the 63,963 resident deaths which occurred in 1964. The rank order of the first five disease categories remained the same for the fourth consecutive year. Deaths due to motor vehicle accidents, increasing by 13.5 percent in 1964, replaced cirrhosis of liver as the sixth leading cause.

DISEASES OF THE CIRCULATORY SYSTEM: The largest number of deaths continue to be charged to diseases of the circulatory system. There were 30,611 such deaths with a death rate of 464.5 per 100,000 population in 1964. In the year preceding 30,210 deaths occurred and the resultant death rate was 467.1. As would be anticipated, this group of diseases appears as the leading cause of death in the age groups 25-44, 45-64 and 65 years and over.

Heart disease deaths continued to increase and accounted for 44 percent of the State's total deaths. Lives terminated fatally by diseases of the heart numbered 28,126 in 1964 and 27,987 in 1963. Mortality rates due to heart diseases were 426.8 per 100,000 population in 1964 and 432.8 in 1963. Although 56 percent of the heart disease deaths occurred to males, the 1964 figures show that an increase occurred in the number of female deaths. This rise was specifically noted in deaths due to the arteriosclerotic and degenerative heart diseases.

CANCER: Deaths from malignant neoplasms ranked second in order of frequency and constituted 18.4 percent of the total resident deaths. Although there was a numerical rise in cancer deaths from 11,624 to 11,801 in 1964, the mortality rate of 179.1 per 100,000 population remained almost unchanged. In 1963 the cancer death rate was 179.7. Cancer was first among principal

cause of death in the age group 5-14 years, and appeared as the second leading cause in each of the other standard age groups.

Deaths due to malignant neoplasms of the respiratory system (including those specified as secondary) showed an increase of ten percent, rising from 2,002 deaths to 2,208 in 1964. The death rates per 100,000 population were 31.0 in 1963 and 33.5 in 1964. A decrease in deaths from cancer of the breast and genito-urinary organs was noted; deaths in 1964 totalled 3,148 as compared with 3,212 deaths in 1963. The mortality rate dropped from 49.7 per 100,000 population to 47.8 in 1964.

VASCULAR LESIONS: A total of 5,597 deaths and a rate of 84.9 per 100,000 population were charged to vascular lesions affecting the central nervous system. Although this group of causes continued to rank third among leading causes of death, there was a drop in both the deaths and the death rate in 1964. Comparable figures for 1963 were 5,733 deaths and a death rate of 88.7. The largest portion of these deaths occurred to those who were 65 years of age and over.

SELECTED RESPIRATORY DISEASES: Of growing importance are respiratory diseases which have been adding to the magnitude of the morbidity and mortality problem. Reporting of morbidity for most of these diseases is not mandatory in New Jersey and the mortality data present but part of the picture. Figures available are based on the underlying cause of death and do not include counts of respiratory diseases when they appear as contributory causes of death.

Influenza, pneumonia and bronchitis, as a group, accounted for three percent of the State's total deaths and ranked fourth among principal causes of death. Although New Jersey experienced a 13 percent drop in deaths charged to these causes in 1964, there were 1,898 deaths with a rate of 28.8 per 100,000 population. Comparable figures for 1963 were 2,157 deaths and a rate of 33.4. Influenza deaths dropped from 72 in 1963 to 10 in 1964; pneumonia deaths (excluding those of the newborn) declined to 1,722 from 1903 in 1963; bronchitis deaths dropped to 166 from 182 in the preceding year.

In 1964 asthma took 114 lives as contrasted to 129 in 1963; chronic interstitial pneumonia accounted for 144 deaths as against 111 in the preceding year; bronchiectasis deaths numbered 60 as compared with 67 in 1963; emphysema without bronchitis was charged with 369 deaths in 1964 and 346 in the year preceding. Information on deaths due to pulmonary tuberculosis and cancer of the lungs appears elsewhere.

More males than females succumbed to these respiratory diseases. Persons 45 years of age and over accounted for the largest number of deaths due to these causes.

DIABETES: Fifth in rank order among principal causes of death, diabetes deaths comprised two percent of the total deaths which occurred to New Jersey residents. Diabetes deaths were lower by six percent and totalled 1,270 deaths in 1964 as compared with 1,351 deaths in the previous year. Death rates amounted to 19.3 in 1964 and 20.9 in 1963.

ALL ACCIDENTS: A thirty percent increase in fatalities due to accidental injuries has occurred since 1954. During this period accidental deaths rose from 2,096 in 1954 to 2,731 deaths in 1964 while the fatality rates went from 39.1 per 100,000 population to 41.4. For comparative purposes, the 1963 deaths due to accidents numbered 2,516 and the rate was 38.9. As a group, accidents accounted for 4.3 percent of the total resident deaths in 1964.

Motor vehicle accidents and accidental falls contributed heavily to the higher fatality rate for all accidents. The numerical increase in motor vehicle accidents amounted to 13 percent in 1964. Deaths due to motor vehicle accidents numbered 1,101 in contrast to 970 deaths which occurred in 1963. The fatality rate rose from 15.0 per 100,000 population in 1963 to 16.7 in 1964. Motor vehicle accidents ranked sixth among leading causes of death.

Accidental falls accounted for 754 deaths in 1964 as against 644 in the year preceding. The death rate per 100,000 population was 11.4 in 1964 and 10.0 in 1963. Seventy percent of all the deaths due to accidental falls occurred in persons 65 years of age and over.

DEATHS FROM REPORTABLE DISEASES: A total of 2,256 deaths resulted from that group of diseases which are reportable for morbidity purposes. Included in this number were deaths from pneumonia and tuberculosis which constitute 90 percent of the entire total.

There were 307 tuberculosis deaths in 1964 yielding a death rate of 4.7 per 100,000 population. Both the deaths and death rate were lower since tuberculosis deaths in the prior year numbered 364 and the death rate was 5.6. Tuberculosis of the respiratory system was credited with 268 deaths and all but 15 of these were due to pulmonary tuberculosis.

No deaths resulted from acute poliomyelitis although four deaths were due to late effects of acute poliomyelitis. Measles claimed eight lives; infectious encephalitis was responsible for 29 deaths; and infectious hepatitis accounted for 21 deaths. Three deaths were due to streptococcal sore throat, including scarlet fever; one death resulted from whooping cough; 9 from meningococcal meningitis; and three from tetanus. No diphtheria deaths occurred in 1964.

INFANT DEATHS BY CAUSE AND AGE: 1964

In 1964 both the number of infant deaths and the infant death rate declined. Infant deaths fell from 3,177 in 1963 to 3,118 in 1964 while the corresponding death rate dropped from 24.0 to 23.7 deaths per 1,000 live births, the lowest since 1954.

As in 1963, babies under one day of age accounted for nearly half (45.8%) of all infant deaths in 1964. Since 1955, almost the entire rise in infant deaths can be attributed to the increase in deaths under one day. A table showing the percent distribution of infant deaths by age group for New Jersey, 1955-1964 follows.

PERCENT DISTRIBUTION OF INFANT DEATHS BY AGE GROUP: 1955 - 1964

Year	Total Percent	Age Group			
		Under 1 day	1 day but < 1 week	1 week but < 28 days	28 days but < 1 year
		Percent	Percent	Percent	Percent
1964	100.0	45.8	24.1	6.9	23.2
1963	100.0	46.8	24.6	7.8	20.8
1962	100.0	44.7	25.8	6.7	22.8
1961	100.0	40.1	28.5	7.5	23.9
1960	100.0	41.7	26.3	7.7	24.3
1959	100.0	40.8	27.5	8.5	23.2
1958	100.0	42.0	26.6	8.4	23.0
1957	100.0	39.6	28.4	8.9	23.1
1956	100.0	40.5	26.4	9.3	23.8
1955	100.0	39.3	27.4	8.1	25.2

Although there was a decline in 1964, postnatal asphyxia and atelectasis continues to cause more infant deaths than any other single cause. In 1964, 769 babies died of this cause as compared with 827 in 1963. Congenital malformations and diseases of the respiratory system accounted for 478 and 280 deaths respectively in 1964. Immaturity unqualified was the reported cause in 450 deaths with 438 of these deaths occurring within the first week of life.

The following tables show infant deaths by age and immaturity, and by cause and age for New Jersey in 1964.

In examining the table showing infant deaths by age and immaturity, it is necessary to remember that "Certain Diseases of Early Infancy" (International Statistical Classification, Major Group XV, Code Numbers 760-776) is the only group which gives an opportunity to determine immaturity on the basis of the physician's statements in the medical certification on the death certificate. However, infant deaths from all causes are included in the table immediately following. The columns labeled "Immaturity Indicated on Death Certificate" pertain to infant deaths coded 760-776 with immaturity indicated on the death certificate. All other infant deaths, (including the balance of deaths coded to 760-776,) were counted in the group labeled "Immaturity Not Indicated on Death Certificate."

INFANT DEATHS BY AGE AND IMMATURITY: 1964

Age	Total		Immaturity Indicated on Death Certificate		Immaturity Not Indicated on Death Certificate	
	Number	Percent	Number	Percent	Number	Percent
< 1 day	1,429	45.8	974	66.6	455	27.5
< 1 week	2,181	69.9	1,413	96.6	768	46.4
< 28 days	2,396	76.8	1,455	99.5	941	56.9
< 1 year	3,118	100.0	1,463	100.0	1,655	100.0

Note: Numbers of deaths for each age classification are cumulative totals from birth to indicated age.
