The sixth annual report of the Public Health Statistics Program of the New Jersey State Department of Health presents the health statistics for calendar year 1967.

This report contains tabular information regarding New Jersey's population, births, marriages, deaths, fetal deaths and reportable diseases. All data are allocated for residence except marriages which are on an occurrence basis.

**Report of the Public Health Statistics Program  
Calendar Year, 1967**

This annual summary of health statistics for 1967 is based on data derived from certificates of live births, marriages, deaths and fetal deaths which, by law, must be filed with the State Registrar. Comparative data for previous years are included for some events in order to indicate recent trends.

Generally, residence information is shown for births, deaths and fetal deaths unless otherwise stated. Marriages are allocated by place of occurrence.

Population estimates for 1967 are those prepared by Research and Statistics, Department of Conservation and Economic Development.

**POPULATION:** New Jersey's population was estimated to have reached 7,078,400 as of July 1, 1967. Since 1960 the gain amounted to more than one million persons or 16.7 percent.

Growth in population through natural increase is at a slower pace. The births exceeded the deaths by 50,497 in 1967. The crude rate of natural increase (the difference between the birth rate and the death rate) amounted to 7 persons per 1,000 population in 1967 or 0.7 percent per year. Gain in population can be attributed to two other factors, military personnel stationed in New Jersey and migration. It is estimated that since 1960, the military population increased by 15,500 and these appear as residents of Burlington and Monmouth Counties, primarily. The balance of the population increase was due to the fact that more persons moved into New Jersey than left the state.

**VITAL EVENTS IN NEW JERSEY:** The numbers of births, deaths and marriages which occurred in New Jersey are shown by month of occurrence.

Vital Events Occurring in New Jersey  
by Month of Occurrence: 1967

<u>Month</u>	<u>Births</u>	<u>Marriages</u>	<u>Deaths</u>
Total	113,014	49,132	64,238
January	9,374	2,760	5,631
February	8,671	2,787	5,213
March	9,374	2,408	5,493
April	9,207	4,067	5,102
May	9,713	3,864	5,486
June	9,547	6,078	5,069
July	10,044	4,812	5,190
August	9,903	4,962	5,082
September	9,635	5,399	5,109
October	9,457	4,304	5,301
November	9,024	3,851	5,618
December	9,065	3,840	5,944

Slightly more than half of the births and deaths occurred in the second half of the year. Marriages in the last six months of 1967 accounted for 55 percent of the total.

**BIRTHS IN NEW JERSEY:** Of the 113,014 infants who were born alive in New Jersey, 99.5 percent were delivered in hospitals. An additional 356 babies were delivered by physicians in other than a hospital. Deliveries by midwives amounted to three.

As expected, boys outnumbered girls. There were 57,838 (51 percent) males as against a total of 55,176 (49 percent) females born in 1967. Most of the births were single births, while twins numbered 2,219 and triplets totaled 45. No quadruplets were born in New Jersey in 1967.

**RESIDENT BIRTHS:** With a reduction in resident births of 3.4 percent, the 1967 total was 116,091 births as compared with 120,116 in 1966. The birth rate of 16.4 per 1,000 population was also lower, having dropped from 17.3 in the preceding year. The United States as a whole has experienced a lower birth rate and, for 1967, the provisional rate was 17.9 per 1,000 population, down from 18.4 in 1966.

The trend of fertility rates is also downward. In 1967 the fertility rate was 79.6 per 1,000 women 15-44 years of age as compared with 82.3 in 1966. The fertility rate for the United States was 87.8 in 1967.

Several reasons have been given for this continued, downward trend. Those presently in the older childbearing ages married early, bore their children in the younger reproductive years, and completed their families at an early period. On the other hand, women who are younger are delaying childbearing.

A comparison of the number of births by age of mother follows for the years 1965-1967. It should be noted that, in 1967, births in each age group were low-

er than in the preceding years with one exception. Births to mothers under 20 years of age were slightly higher in 1967 than in 1965, but lower than in 1966.

Age Group of Mother	Number of Births		
	1967	1966	1965
All Ages	116,091	120,116	125,104
< 20 years	13,679	14,500	13,636
20 - 24 years	40,281	41,016	41,721
25 - 29 years	32,570	32,675	34,286

40 - 44 years	2,476	2,635	2,975
45 +	137	122	121
Unstated	18	15	16

Births out-of-wedlock were 8.0 percent of total live births in 1967 in contrast to 7.2 in 1966. There were 9,267 illegitimate births in 1967, having risen from 8,634 a year earlier, an increase of 7.3 percent.

Females under 15 years of age accounted for 210 live births and, of these, 198 were born out-of-wedlock. Of the 13,469 live born infants whose mothers were 15-19 years of age, 4,189 (31 percent) were illegitimate. An additional 3,070 births out-of-wedlock occurred to women 20-24 years of age.

RESIDENT BIRTHS BY WEIGHT GROUP: Most of the live born infants weighed 2501 grams or more at birth. Of the 114,543 babies for whom birth weight was stated, 8.5 percent or 9,750 infants weighed 2500 grams or less. The latter group, known as immature births, included 1,502 babies who were born out-of-wedlock. The following table shows resident births according to the weight group of the child together with the percent of each weight group to the total number of births for which weight was known. There were 1,548 birth certificates on which weight was not stated.

Resident Births by Weight Group, Number and Percent

<u>Weight Group</u>	<u>Number</u>	<u>Percent</u>
5001 grams or more	146	0.1
4501-5000 grams	1,181	1.0

1000 grams or less	714	0.6

Total with weight given 114,543 99.8

MARRIAGES: In 1967 there was an increase of 4.6 percent in the number of marriages performed in New Jersey. Marriages totaled 49,132 as compared with 46,966 marriages in 1966. The marriage rate per 1,000 population was 6.9 and was above the 1966 rate of 6.7. New Jersey's marriage rate is considerably below the provisional 1967 rate of 9.7 per 1,000 population for the United States.

Except for the months of February, May and October, all other months showed an increase in marriages performed in 1967. June, as usual, was the peak month for marriages with September ranking second and August, third.

The largest number of those who married were in the age group of 20-24 years. Brides (23,626) and grooms (23,176) in this age group comprised 48 percent of the total number of persons married in 1967 as compared with 45 percent a year earlier. Teenagers were the second largest group to enter matrimony, although not in as great a number as in 1966. A total of 15,977 teenagers were married in 1967 or 6.4 percent fewer than the total of 17,065 in 1966.

First marriages for both bride and groom totaled 37,639. There were 2,693 widows and 2,628 widowers married in 1967. Those whose previous marriages were dissolved by divorce and who remarried in 1967 numbered 5,424 females and 6,001 males.

Since 1958, marriages increased by 28 percent. In that year marriages totaled 38,398 as compared with 49,132 marriages in 1967. Marriage rates during this ten year period ranged from a low of 6.5 per 1,000 population to 6.9.

**DEATHS:** There were 65,594 deaths from all causes and a mortality rate of 9.3 per 1,000 estimated population in 1967. These were somewhat lower than the 65,656 deaths with a death rate of 9.4 in 1966. The provisional 1967 death rate for the United States was 9.4 per 1,000 population as compared with 9.5 a year earlier.

**INFANT DEATHS:** Deaths of infants less than a year old decreased by 4.0 percent and amounted to 2,578 in 1967 as compared with 2,688 infant deaths in 1966. The infant mortality rate of 22.2 per 1,000 live births showed very little change from the rate of 22.4 in 1966. The provisional 1967 infant mortality rate for the United States was 22.1 per 1,000 live births as compared with 23.7 in 1966.

Of the 2,578 infants who died, 1,235 (47.9 percent) failed to survive the first day of life; 593 (23.0 percent) babies died when they were less than one week old; 168 (6.5 percent) more died before completing the first 27 days of life; and 582 (22.6 percent) failed to complete the first year of life.

Neonatal deaths (i.e. deaths of infants less than 28 days old) amounted to 1,996 deaths in 1967 and 2,047 deaths in 1966. Neonatal mortality rates per 1,000 live births were 17.2 and 17.0, respectively.

Perinatal deaths, which are a combination of infant deaths under seven days of age and fetal deaths, totaled 3,715 in 1967 as against 3,743 perinatal deaths a year earlier. The perinatal mortality rate in 1967 was higher, since it rose from 30.7 per 1,000 total deliveries in 1966 to 31.5.

**MATERNAL DEATHS:** Mothers who died from causes associated with deliveries and complications of pregnancy, childbirth, and the puerperium numbered 45, four more than in 1966. The maternal mortality rate for 1967 was 0.4 per 1,000 live births, up from 0.3 in 1966. In 1967 there was one maternal death for every 2,580 live births. This was less favorable than the ratio of 1 to 2,930 for the year preceding.

The distribution by age of the maternal deaths was as follows: one under 15 years of age; 10 were 15-24 years old; 33 were 25-44 years old; and one was 45 years of age or older.

**FETAL DEATHS:** There were 1,887 fetal deaths with a rate of 16.3 per 1,000 live births in 1967. Comparable figures for 1966 were 1,865 fetal deaths and a rate of 15.5.

**LEADING CAUSES OF DEATH:** The following seven leading causes of death continue to account for 84 percent of all fatalities. The cause-of-death rank order is shown together with the number of deaths and percent of total deaths each cause of death constituted.

<u>Rank</u>	<u>Cause</u>	<u>Deaths</u>	<u>Percent</u>
1.	Diseases of the circulatory system	31,316	47.7
	Diseases of the heart	28,829	44.0
2.	Malignant neoplasms	12,189	18.6
3.	Vascular lesions affecting central nervous system	5,979	9.1
4.	Influenza, pneumonia and bronchitis	1,984	3.0
5.	Diabetes	1,360	2.1
6.	Motor vehicle accidents	1,216	1.9
7.	Cirrhosis of liver	1,158	1.8

**DISEASES OF THE CIRCULATORY SYSTEM:** Consisting mostly of heart disease deaths, diseases of the circulatory system continued to account for approximately 48 percent of total deaths. Of the 31,316 deaths assigned to this category, 28,829 deaths were due to diseases of heart. Numerically, heart disease deaths were slightly higher than in 1966 when the total was 28,815. The mortality rate for diseases of heart was 407.3 per 100,000 population in 1967 and 414.0 in 1966, a reduction of 1.6 percent.

For most victims of heart disease, the underlying cause of death was stated as arteriosclerotic heart disease, including coronary disease. Approximately 82 percent of all heart disease deaths were assigned to this group and deaths numbered 23,500 in 1967 as against 23,439 in the preceding year. Heart disease is the leading cause of death and its target is the population 45 years of age and over.

**CANCER:** Second in order of frequency, malignant neoplasms accounted for 18.6 percent of total deaths. In 1967 cancer deaths totaled 12,189, up from 11,997 deaths a year earlier. The death rates remained about the same in both years, 172.2 in 1967 and 172.4 in 1966.

Chiefly responsible for the 1.6 percent rise in cancer deaths were the increases in deaths due to malignant neoplasm of digestive organs and peritoneum and malignant neoplasm of the respiratory system.

VASCULAR LESIONS: Approximately 9.1 percent of the total deaths were due to vascular lesions affecting the central nervous system. There were 5,979 such deaths in 1967 as compared with 5,904 deaths in 1966. Death rates for each of these two years showed little change, 84.5 per 100,000 population in 1967 and 84.8 in 1966. As in the case of heart disease and cancer most of the victims of "stroke" are those 45 years of age and over.

SELECTED RESPIRATORY DISEASES: Pneumonia, influenza and bronchitis, combined, were fourth in order of frequency and accounted for three percent of all deaths in 1967. Persons who succumbed to this group of diseases numbered 1,984 in that year as compared with a higher total of 2,157 in 1966. A lower death rate, primarily due to fewer influenza and pneumonia deaths, resulted in 1967 and amounted to 28.0 per 100,000 population as against 31.0 in the previous year. Pneumonia deaths numbered 1,753, influenza 17 and bronchitis 214 deaths.

There were 112 deaths due to asthma as compared with 100 deaths in 1966. Emphysema, without mention of bronchitis, accounted for 531 deaths as against 517 in 1966. A 17 percent decline in deaths due to tuberculosis of the respiratory system was noted and there were 232 deaths in 1967 as compared with 281 deaths in the year preceding. Cancer of the respiratory system (not specified as secondary) was responsible for an increased number of deaths, rising from 2,275 deaths in 1966 to 2,322 in 1967.

More males than females succumbed to this group of diseases and most of the victims were 45 years of age and over.

DIABETES: Continuing as the fifth leading cause of death, diabetes deaths were 2.1 percent of total deaths in 1967. A small reduction in both the number and death rate was noted in 1967. There were 1,360 diabetes deaths with a rate of 19.2 per 100,000 population as compared with 1,388 deaths and a death rate of 19.9 in 1966. More females (814) than males (546) died of diabetes and most of these victims were 45 years of age or older.

ALL ACCIDENTS: Fatalities due to injuries received in accidents amounted to 2,914 deaths in 1967, four more than in 1966. Death rates per 100,000 population were 41.2 in 1967 and 41.8 a year earlier. A large portion of these deaths occurred as a result of motor vehicle accidents (42 percent) and accidental falls (24 percent).

An increase of 7.1 percent occurred in fatalities resulting from motor vehicle accidents. A total of 1,216 persons died in 1967 as compared with 1,135 in 1966. The death rate rose from 16.3 per 100,000 population to 17.3 in 1967. Appearing as the sixth leading cause of death, motor vehicle accidents were 1.9 percent of total deaths. Male deaths (883) outnumbered female deaths (333).

The gain in motor vehicle accident deaths was offset by a 6.3 percent decline in accidental deaths due to falls. A total of 700 fatalities resulted from this type of accident in 1967 and 747 deaths in 1966. More females (364) than males (336) died because of such injuries. Accidental falls rank eighth among leading causes of death. The death rate for the year was down from 10.7 in 1966 to 9.9 per 100,000 population.

SUICIDES: Fewer deaths by suicide occurred in 1967 than in 1966. The deaths in the former year totaled 505 and 548 in the latter year. The death rate of 7.1 per 100,000 population was down from 7.9 in 1966. Of the 505 persons who died by suicide, 350 were males and 155 were females. Four of those who died were less than 15 years old, 48 were between 15-24 years of age, and the remainder were 25 years old or more.

HOMICIDES: An increase of 24.6 percent in deaths due to homicide occurred in 1967. Fatalities rose from 240 in 1966 to 299 in 1967. The death rate of 4.2 per 100,000 population was also higher than the rate of 3.4 recorded in 1966. Most of the deaths occurred between the ages of 15 and 44 years. Twelve infants under one year and 10 children between 1 and 14 years died by this means. Of the 299 fatalities, 213 were males and 86 were females.

DEATHS FROM OTHER SELECTED CAUSES: A reduction in deaths from tuberculosis occurred in 1967. The drop was from 297 deaths in 1966 to 261 the following year. The tuberculosis death rate, per 100,000 population, declined from 4.3 in 1966 to 3.7 in 1967.

There were 12 deaths from infectious encephalitis (including late effects), 30 deaths due to infectious hepatitis, 13 deaths from meningococcal meningitis, two from whooping cough, and one from tetanus. No deaths occurred from the following: acute poliomyelitis, diphtheria, measles, typhoid fever or smallpox.

## REPORT ON INFANT DEATHS BY CAUSE AND AGE: 1967

Fewer deaths of infants under one year of age occurred in 1967 than in 1966. Infant deaths, numbering 2,578 in 1967 and 2,688 in 1966, declined by 4.0 percent. The infant mortality rate changed but slightly, dropping from 22.4 in 1966 to 22.2 per 1,000 live births in 1967.

Resident births, on which infant mortality rates are based, declined from 120,116 in 1966 to 116,091 births in 1967. The numerical reduction amounted to 3.4 percent for the year.

The largest portion of infant deaths occur within the first day of life. Such deaths, in 1967, amounted to 1,235 or 47.9 percent of the total. Deaths of babies under one day numbered 1,216 and were 45.2 percent of the 1966 infant death total.

A reduction of 10.4 percent occurred in the number of deaths of infants who survived the first day but not the first week. These totaled 593 deaths and represented 23.0 percent of all deaths under one year in 1967. A year earlier the number was 662 deaths or 24.6 percent of all infant deaths.

Babies who were a week old but less than 28 days of age at the time of death represented 6.5 percent of the total or 168 infant deaths. In 1966, this group of deaths equaled 169 and were 6.3 percent of the total deaths under one year.

An additional 582 babies, or 22.6 percent, lived beyond the first 28 days but did not reach the first birth day. Comparative figures for 1966 were 641 deaths, representing 23.8 percent of all deaths under one year. The decline in deaths was 9.2 percent in 1967.

Of the 2,578 infant deaths, 1,695 (66 percent) were assigned statistically to the overall cause category, Certain Diseases of Early Infancy. A large number (1,106) of these deaths were of infants less than a day old.

Deaths from such nonspecific diagnoses as postnatal asphyxia and atelectasis, and immaturity, constitute a large share of those described as due to Certain Diseases of Early Infancy. In 1967, 555 deaths were charged to postnatal asphyxia and atelectasis and 464 deaths were assigned to immaturity. Altogether, 60 percent of the deaths in this overall category were assigned to these nonspecific diagnostic groups.

Congenital malformations, one of the more specific causes of death, accounted for 371 infant deaths, three more than in 1966. Of the total deaths under one year, 14.4 percent were attributed to this cause. Deaths due to diseases of the respiratory system numbered 222 and were 8.6 percent of all infant deaths. One death from influenza and 192 deaths from pneumonia (exclusive of pneumonia of the newborn) were included in the 222 deaths.

Fewer infants died from birth injuries in 1967. There were 176 deaths due to this cause as against 196 the preceding year. Birth injuries represent 6.8 percent of deaths under one year. Infant deaths charged to accidents were also lower, having dropped from 114 deaths in 1966 to 103 in 1967. These deaths were 4.0 percent of all infant deaths.

There were 61 deaths from diseases of the digestive system as compared with 56 infant deaths in 1966. As a group, infective and parasitic diseases were responsible for 23 deaths in 1967 as compared with 34 deaths a year earlier.

The following tables show infant deaths by age and immaturity, and by cause and age for New Jersey in 1967. The columns labeled "Immaturity Indicated on Death Certificate" pertain to infant deaths coded 760-776 with immaturity indicated on the death certificate. All other infant deaths (including the balance of deaths coded to 760-776) were counted in the group labeled "Immaturity Not Indicated on Death Certificate."

Infant Deaths by Age and Immaturity: 1967

Age	Total		Immaturity Indicated on Death Certificate		Immaturity Not Indicated on Death Certificate	
	Number	Percent	Number	Percent	Number	Percent
