JOANNE E. FINLEY, M.D., M.P.H.
COMMISSIONER

December, 1978

This report is the sixteenth of a series of annual reports published by the New Jersey State Department of Health, summarizing birth, marriage, death and morbidity statistics for the calendar year ending December 31, 1977.

The vital statistics reporting system is the oldest health statistics reporting system in the United States, and today remains, the backbone of all health data systems. Birth, marriage, and death statistics, when utilized properly, can serve as an important indicator of health status and social welfare, and when interpreted correctly, can indicate where the need for improvement or change in the health care delivery system exists.

This report has been expanded to include additional materials which have proven to be useful in developing a more complete and accurate picture of the health status of the citizens of this state. I commend the contents to your careful study and analysis.

A handwritten signature in cursive script, reading "Joanne E. Finley".

Joanne E. Finley, M.D., M.P.H.
State Commissioner of Health

TABLE OF CONTENTS

| Table No. | Page No. |
|--|----------|
| Report of the Public Health Statistics Program, Calendar Year, 1977 | 1 |
| VITAL EVENTS HISTORICAL DATA | |
| 1. Population Estimates, Resident Births, Marriages (by Occurrence) and Resident Deaths, Numbers and Rates per 1,000 Population: 1953 - 1977 | 9 |
| 2. Infant, Fetal, Neonatal, Perinatal and Maternal Resident Deaths, Numbers and Rates: 1953 - 1977 | 10 |
| 3. Cancer, Diabetes, Heart Disease and Cerebrovascular Disease Deaths, Numbers and Rates per 100,000 Estimated Population: 1953 - 1977 | 11 |
| 4. Accident, Homicide and Suicide Deaths, Numbers and Rates per 100,000 Estimated Population: 1953 - 1977 | 12 |
| 5. Tuberculosis Cases and Deaths, Numbers and Rates per 100,000 Estimated Population: 1953 - 1977 | 13 |
| 6. Cases of Syphilis by Stage, and Gonorrhoea, Numbers and Rates per 100,000 Estimated Population (Civilian Cases Only): 1953 - 1977 | 14 |
| VITAL EVENTS DATA — TOTAL NEW JERSEY: 1977 | |
| 7. Estimated Population by Age, by Race, by Sex: 1977 | 15 |
| 8. Resident Births by Age of Mother, by Race, by Sex: 1977 | 16 |
| 9. Resident Births by Age of Mother, by Legitimacy and Age: 1977 ; | 17 |
| 10. Resident Births by Age of Mother by Weight Group: 1977 | 18 |
| 11. Resident Births by Weight Group by Race: 1977 | 19 |
| 12. Marriages in New Jersey by Age of Husband, by Age of Wife: 1977 | 20 |
| 13. Marriage Trends for 1976 and 1977, by Month | 21 |
| 14. Previous Marital Status of Husband and Wife: 1977 | 22 |
| 15. Estimated Average Age at Marriage, 10 Year Trend | 22 |
| 16. Principal Causes of Infant Deaths: 1977 | 23 |
| 17. Resident Infant Deaths by Cause, by Age: 1977 | 24 |

| Table No. | | Page No. |

Report of the Public Health Statistics Program

Calendar Year, 1977

Introduction

This report is the sixteenth of a series of annual reports summarizing vital statistics data for the state of New Jersey. Enclosed within its covers is basic information on births, marriages, deaths, fetal deaths, disease morbidity and population for 1977. Due to publication size limitations some detailed vital statistics information has been excluded from this report, but is available upon request. Some back issues of the report are still available and can be obtained from the Public Health Statistics section of the Health Data Services Program. Vital statistics data covering the period 1877-1961 are included in the report "New Jersey Health". Reference copies are maintained by the Public Health Statistics unit and the Health Department library.

Birth, marriage, death and fetal death statistics included in this report were gathered from certificates filed with the state registrar prior to April 15, 1978. Through a reciprocal arrangement between states copies of birth, death, and fetal death certificates involving out-of-state occurrences are interchanged. Thus the resident birth, death, and fetal death rates shown in the report include all events involving residents of the State of New Jersey irrespective of place of occurrence. Marriage statistics are treated in a somewhat different fashion. A tabulation is made of all marriage events occurring within the state irrespective of residence of either party. Copies of marriage certificates are not interchanged between states as such a procedure would prove impractical.

The Tuberculosis Services Program, the Venereal Disease Control Program, and the Communicable Disease Control Program are responsible, by law, for maintaining confidential files on "reportable diseases". Statistics generated by these units are included in this report in order to allow the user to develop a more complete profile of the health of the residents of the state. Requests for detailed statistics should be directed towards these various units. The newly formed Cancer Registry has not, as yet, developed a base file of cancer patients within the state so that morbidity statistics involving this disease are not available at this time.

The Office of Demographic and Economic Analysis, Department of Labor and Industry was given the responsibility of providing annual estimates of the population of New Jersey and its 567 municipalities. These estimates are periodically revised to reflect the latest information available with respect to births, deaths and migration. Summary counts for the state, each county, and each municipality, published on November 1, 1978 for the year ending June 30, 1977 were used in developing the vital statistics rates shown in this report. Natality, mortality, and morbidity rates for prior years were also recalculated based on revised population figures. Age, race, and sex specific population estimates for 1977 were not developed by the Office of Demographic and Economic Analysis. The figures shown in this report are crude estimates developed by the Public Health Statistics Unit, and are to be used for statistical purposes only. The population for 1977 was assumed to have the same age, race, and sex distribution as existed in 1975 based on experimental data developed for that year.

The format of this report reflects the format used in 1975 and earlier years. The first section includes a series of trend tables covering the period 1953 - 1977. The second section contains detailed statistics for the state. The third section shows a breakdown of vital statistics for each county and some selected municipalities. The selected municipalities

include those municipalities with populations of 50,000 or more as of 1970. Following the 1980 census a new set of selected municipalities will be developed to reflect shifts in the population within the state. The last section contains general statistics for each of the 567 municipalities within New Jersey.

Inquiries regarding the contents of this report, requests for copies of this report, and requests for additional information should be addressed to:

Population

Since 1953 New Jersey's population has increased approximately 40%. Recent published population estimates from the Department of Labor and Industry indicate a leveling off of the population growth, perhaps due to economic influences affecting migration from New Jersey. The revised figure for 1975 represented a decrease of 0.6 percent from the 1974 estimate. The 1976 estimate showed a gain of 0.1 percent. However, the 1977 estimate again reflected a decrease, although moderate, of 0.1 percent. Of course, such estimates are subject to errors, and their accuracy can only be judged by data resulting from the 1980 census to be conducted in April of that year. However, the latest estimates are consistent with earlier estimates which showed a slowdown of population growth during the last ten years.

The population of Ocean County is estimated to have increased the greatest, rising from 306,000 to 318,000 people over the past year (1976-1977). Other counties estimated to have grown are Burlington, Cape May, Gloucester, Hunterdon, Middlesex, Monmouth, Morris, Somerset, Sussex and Warren Counties. Salem County's population remained relatively stable, while all other counties lost people. Essex County's population is estimated to have declined the greatest (2.0 percent). The population of Newark is estimated to have declined by more than 9,000 persons.

New Jersey remains, however, the most densely populated state in the country with its 7 million plus people occupying a land area of 7,521 square miles or 977.1 persons per square mile. Jersey City, New Jersey remains the most densely populated city in the country with more than 12,000 persons residing within each square mile.

Vital Events in New Jersey

Although most of the tabulated information in this report concerns resident occurrences, that is, births and deaths of residents of the State of New Jersey irrespective of place of occurrence, it is sometimes important, when planning for health care services, to consider all events occurring within state boundaries irrespective of residence.

In 1977 there were 64,329 deaths occurring in the state, and 91,127 births. There were 65,646 resident deaths reported in 1977 and 93,786 resident births. One can assume that of those events occurring within state borders, most involved residents of the state while a small proportion (less than 1%) involved nonresidents.

Of the 91,127 births reported, 46,617 were males and 44,510 were females. There were 71,984 white births and 19,129 nonwhite births reported, while 14 birth certificates lacked such information. A total of 16,442 illegitimate births were registered (18.0%). Most births occurred in the hospital (90,727). Of these there were 89,906 deliveries by physicians and 821 reported deliveries by registered nurses and midwives. There were another 400 deliveries outside of hospitals with physicians attending 135, and midwives attending 155. A total of 1,896 twins and 32 triplets were born. The number of sets of twins and triplets could not be calculated from existing data. There were 6,803 immature births (less than 2,501 grams) or 7.5% of all births.

Of the total of 64,329 deaths occurring in New Jersey, there were 34,024 male deaths and 30,305 female deaths, with 57,765 white and 6,564 nonwhite deaths reported.

Table A shows the frequency of births and deaths in New Jersey by month of occurrence.

Table A

| Month | Births | | Deaths | |
|-----------|--------|---------|--------|---------|
| | Total | Per Day | Total | Per Day |
| January | 7485 | 241 | 5827 | 189 |
| February | 6950 | 248 | 5200 | 186 |
| March | 7665 | 247 | 5670 | 183 |
| April | 7379 | 246 | 5131 | 171 |
| May | 7748 | 250 | 5303 | 171 |
| June | 7753 | 258 | 5006 | 167 |
| July | 7933 | 256 | 5421 | 175 |
| August | 8044 | 259 | 5094 | 164 |
| September | 7755 | 259 | 4859 | 162 |
| October | 7806 | 252 | 5366 | 173 |
| November | 7330 | 244 | 5302 | 177 |
| December | 7279 | 235 | 6150 | 198 |

Mortality is higher during the winter months (December through March) while an increase of births occurs during the summer.

Resident Births

General Information

In 1977 there were 93,786 resident births, an increase of 3.6 percent over the reported 90,549 resident births reported during the previous year. The birth rate, which has steadily declined over the past twenty-five years suddenly rose from 12.3 to 12.8 births per 1,000 population. This rise was not unexpected inasmuch as the number of women in childbearing ages was predicted to increase dramatically over the next several years producing a higher birth rate. There were 93,506 births to women aged 15-44 compared to 90,224 such births in 1976. The estimated fertility rate in 1976 was 55.2. In 1977 the estimated fertility rate is 58.9. These figures are, of course, subject to error due to errors in the crude population figures used in their estimation. It is more likely that the fertility rate remained unchanged. However, with the increased number of women in the childbearing age group the birth rate would still have increased.

In 1976 there were 70,457 births reported among the white population and 18,611 births reported among the nonwhite population, with 1,481 births unknown as to race. In 1977 white births increased 3.5 percent and nonwhite births increased 3.4 percent, with 72,944 and 19,249 births reported respectively. Failure to receive racial information on birth certificates remained a major problem as 1,593 such certificates were filed. By assuming a similar racial distribution among births for which no such information was given, esti-

mates of race-specific birth rates can be computed. Among the white population the estimated birth rate rose from 11.1 to 11.6 births per 1,000 persons, while the nonwhite estimated birth rate rose from 20.4 to 21.1 births per 1,000 people. The nonwhite birth rate appears to have risen faster than the white birth rate and remains almost twice as high.

Legitimacy

For the past several years the percentage of illegitimate births has tended to increase at an alarming rate. The general feeling of the health community is that mothers carrying babies out-of-wedlock tend to receive less than adequate prenatal care, and babies born out-of-wedlock do not always receive needed neonatal care. Current statistics are inadequate in proving or disproving these beliefs. Still, data on the illegitimacy rates does foster serious concerns in this area. In 1976 there were 5,535 white illegitimate births and 9,532 nonwhite illegitimate births reported. In 1977 a total of 6,345 white and 10,135 nonwhite illegitimate births were reported representing increases of 14.6 and 6.3 percent respectively. White illegitimate births represent 8.7% of all white births while nonwhite illegitimate births encompass 52.6 percent of all nonwhite births. Of the total of 16,524 illegitimate births, 44.7% (7,381) were to teenage mothers while another 34.2% (5,650) were to mothers aged 20-24. The illegitimacy rate decreases with age of mother as might be expected. Over sixty percent of teenage births were illegitimate, while 21.2 percent of mothers aged 20-24 delivered babies out of wedlock. By contrast, of the 32,271 births to women aged 25-29, only 6.9 percent were illegitimate.

The terms "legitimate" and "illegitimate" were used in the above analysis and throughout this report in place of the terminology "in-wedlock" and "out-of-wedlock" for lack of more convenient terminology and do not in any way imply any legal or moral significance.

Birth Weight

Birth weight information was given on 98.1 percent of resident birth certificates. Birth weight is one of the variables used to measure the health of infants as low birth weight infants tend to develop more problems during the first year of life than babies weighing more than 2501 grams at birth. Data is still inconclusive concerning the affects of birth weight on physical and emotional development in later stages of child development although some associations have been noted. In 1977 there were 6,906 immature births reported (7.4%) as compared to 6,745 (7.5%) in 1976. Among the white population 6.0 percent (4,386 births) of all births were 2500 grams or less (5 lb. 8 oz.) while 13.1 percent (2,519) of nonwhite births were immature. Teenage mothers delivered 1,422 immature babies (11.7% of teenage births). There were 2,184 illegitimate births under 2501 grams, representing 13.2 percent of all illegitimate births, lending further concern to the all ever rising illegitimacy rate, and bearing evidence to the concern that unwed mothers do not receive appropriate prenatal care.

Prenatal Care History

In 1977 there was some improvement in the reporting of prenatal care history, however there were still better than 8 percent of certificates with this information missing. A total of 86,026 certificates contained prenatal care information. There were 879,978 reported visits or 10.2 visits per patient, the same ratio reported in 1976. Of those women reporting complete prenatal care histories, nearly three-fourths (74.5%) began care during the first trimester, while only 5.5 percent failed to receive care before the third trimester. Less than 10 percent of women reported prenatal care during the first month of pregnancy. Most women began care in the second month (37.3%) and third month (27.7%). Similar data for 1976 showed 35.9% of women beginning care in the second month and 28.1% during the third month.

The birth rates for Sussex and Cumberland Counties (16.0) were the highest among New Jersey's twenty-one counties. Both represented increases from 1976 reported rates of 15.0 and 15.4 respectively. Atlantic (14.1), Camden (14.7), Essex (14.0), Gloucester (13.8), Hudson (14.1), Ocean (13.8), Passaic (14.0), Salem (14.3) and Warren (13.5) counties all reported rates above the state average. The birth rates in Bergen County (9.6), and Somerset County (10.2) were the lowest. The 1976 rates cited, were recomputed from previously reported figures based on the latest population estimates. In 1977 the cities of Camden (22.9), Newark (19.2) and Passaic (18.6) reported the highest birth rates among the selected cities examined.

Marriages

The decline in the total number of annual marriages continued through 1977 with a further drop of 1.2% from 1976. In all there were 50,677 marriages in 1977 compared with 51,291 in 1976. However this percentage decline was considerably smaller than in previous years. As usual the winter months generated the fewest number of marriages when compared with the other three seasons. Since 1973 there has been an overall decrease of 15.1% in the annual number of marriages. Of all men who were married in 1977, 26.1% had been previously married. Likewise, 23.2% of all 1977 brides had previous marital experience. This was a continuation of an upward trend of second-time marriages with a commensurate downward trend of first-time grooms and brides. In fact, 33.9% of all marriages in 1977 involved previous marital experience by the bride and/or groom. In 1977 there was a 3.4% increase over 1976 in the number of divorced men who remarried with a corresponding increase of 3.0% for divorced women. As the rate of divorce tends to increase this produces more eligible divorced men and women for remarriage and consequently reduces the overall percent of first-time marriages.

Apparently there is also a trend by both sexes to wait longer before marrying since the average estimated age of grooms in 1977 was 29.1 with a corresponding estimated age of 26.4 for brides. Both represent a 10 year high (see Table 15). This also partially explains an overall reduction in the total number of marriages from recent years. There was also a drop in the rate of teenage brides (16.6%) compared with 17.7% in 1976.

Mortality

Resident Deaths

With the population of New Jersey increasing by forty percent over the last twenty-five years the number of resident deaths has likewise increased. Of more importance, however, is the mortality rate, the ratio of deaths to population size, which has declined steadily. In 1953, there were 1008.3 deaths per 100,000 persons, while in 1963, 981.0 deaths per 100,000 persons were reported. By 1973 this ratio had dropped to 931.4 deaths per 100,000 persons. During the last three years (1975-1977) the mortality rate has remained relatively stable with 890.1, 887.1 and 893.3 deaths per 100,000 persons reported, respectively.

There were 31,279 white male deaths, 27,641 white female deaths, 3,767 nonwhite male deaths and 2,959 nonwhite female deaths. The mortality rates for all but nonwhite males appear to have increased. The 1977 white male rate was 1006.6 deaths per 100,000 persons compared with a 1976 rate, based on the latest population estimates of 995.2. The white female rate increased from 830.3 in 1976 to 833.7 in 1977. Neither increase was substantial, and might, in fact, reflect inaccuracies in the population estimates used to com-

pute them. There were 1% fewer nonwhite male deaths in 1977, resulting in a reduction of the estimated rate from 873.2 to 863.9 deaths per 100,000 nonwhite males. There were 604.0 nonwhite female deaths per 100,000 population in 1977 compared with a 1976 rate of 598.2.

Infant, Fetal and Maternal Mortality

Infant mortality involves deaths of persons under one year of age, and is usually measured relative to the number of live births recorded during the same year. In 1977 the number of infant deaths (1,355) and the infant mortality rate (14.4 deaths per 1,000 live births) were the most ever recorded in New Jersey. Since 1953 the number of infant deaths has decreased 48.9 percent, while the infant mortality rate has declined 39.0 percent. The most dramatic declines have occurred during the last ten years. In 1967 there were 2,578 infant deaths with a mortality rate of 22.2 deaths per 1,000 live births. Thus, in the last ten years the infant mortality rate has declined thirty-five percent. This dramatic decline reflects both improved prenatal care and improved neonatal care.

There were 889 white and 466 nonwhite infant deaths in 1977 compared to 893 white and 473 nonwhite infant deaths reported in 1976. Using estimated birth figures by race (racial information was not available in all birth certificates) the white infant mortality rate decreased from 12.5 to 12.0 deaths per 1,000 live births while the nonwhite infant mortality rate, nearly twice as high, decreased from 25.0 to 23.8 deaths per 1,000 live births.

Most infant deaths occur during the first month of life. Such deaths are referred to as neonatal deaths. In 1977, there were 1,013 neonatal deaths (74.8% of all infant deaths). The percent of infant deaths occurring during the first month of life has not changed substantially over the last twenty-five years. The mortality rate of 10.8 based on 1,013 was subsequently the lowest ever recorded in New Jersey. The number of neonatal deaths has declined nearly 50 percent since 1967, while the mortality rate has dropped from 17.2 to 10.8, a reduction of 37.2 percent. There were 697 white and 316 nonwhite neonatal deaths reported in 1977 with rates of 9.4 and 16.1 resulting, respectively. Both represent reductions from the estimated rates of 9.7 and 17.8 deaths per 1,000 births reported in 1976. 7.2 15.1

A fetal death (stillbirth) is defined as a death occurring prior to complete expulsion or extraction from its mother of a product of conception. Another commonly used term is spontaneous abortion. Fetal deaths occurring after completion of twenty or more weeks gestation are required by law to be reported to the state registrar. Although the reported number of fetal deaths and the corresponding fetal death rate has declined over the past twenty-five years, the last three years has seen an increase. In 1953 there were 2,046 fetal deaths with a rate of 18.2 fetal deaths per 1,000 live births. In 1975, 941, fetal deaths were reported producing a rate of 10.3. In 1976 and 1977, 1,004, and 1,083 fetal deaths were recorded producing rates of 11.1 and 11.5 respectively. The figures for the past two years could, perhaps, have resulted from improved reporting of events, although it is difficult to validate this assumption. The fetal death rate in the white population rose from 9.7 in 1976 to 10.1 in 1977. Among nonwhites the fetal death rate rose from 15.9 to 16.6 during the same period.

Perinatal mortality is a composite statistic used to measure the critical period in human development just prior to birth and shortly thereafter. Perinatal mortality, as presented in this report includes fetal deaths plus neonatal deaths. Since 1953, perinatal mortality has decreased nearly fifty percent with the mortality rate dropping from 35.7 to 22.1 deaths per 1,000 live births plus fetal deaths.

During the last twenty-five years maternal deaths have been reduced dramatically and may in the near future be entirely eliminated if present trends continue. In 1977, there were only 13 such deaths reported or 1.4 deaths per 10,000 live births. As recently as 1963, 50 maternal deaths were reported. There were seven nonwhite deaths and six white deaths. Deaths were attributed to Ectopic pregnancy, (3), toxemias of pregnancy and the puerperium (5), deliveries complicated by retained placenta (2), and puerperal pulmonary embolism (3).

Principal Causes of Infant Mortality

The ten leading causes of infant mortality in 1977 were congenital anomalies (280), symptoms and ill defined conditions (133), immaturity, unqualified (124), respiratory distress syndrome (100), asphyxia of the newborn (100), complications of pregnancy (95), hyaline membrane disease (85), all other conditions of the newborn (71), birth injury without mention of cause (52), and pneumonia (47).

The number of infant deaths due to congenital anomalies increased by 16 percent over the reported 241 such deaths in 1976, with the rate rising from 26.6 to 29.9 deaths per 1,000 live births. Congenital anomalies of the heart resulted in 93 deaths, congenital anomalies of the respiratory system in 29 deaths, congenital anomalies of the circulatory system in 22 deaths, anencephalus in 24 deaths, and congenital anomalies affecting multiple systems in 49 deaths. Seventy-one percent of congenital deaths occurred during the first month of life.

Most deaths attributed to symptoms and ill-defined conditions occurred in later stages of infancy (28 days or more after birth). The same is true of deaths due to pneumonia. All but 12 deaths attributed to symptoms and ill-defined conditions, and all but 18 pneumonia deaths occurred in older infants.

By contrast, of the 124 deaths due to immaturity, 119 occurred during the first day of life. Of the 100 deaths resulting from respiratory distress, 45 occurred within 24 hours, while another 43 occurred within the first week. Of the 100 deaths due to asphyxia, 72 occurred in the first day, and another 20 prior to completion of one week of life. A total of 82 out of 95 deaths due to complications of pregnancy occurred within 24 hours. Hyaline membrane disease caused death in 29 infants during the first day of life and another 44 infants under one week of life. In all, 586 out of 1,355 (43.2%) infant deaths occurred within twenty-four hours, with a total of 872 infants dying (64.4) before completion of one week of life.

Deaths due to symptoms and ill-defined conditions rose 29 percent from the reported 103 deaths in 1976. Respiratory distress caused 18 percent fewer deaths than the 1976 reported 122 deaths. Asphyxia deaths dropped 15 percent from 1976's reported 118 deaths. The greatest decrease occurred in the number of deaths attributed to complications of pregnancy. In 1976, 132 such deaths were reported compared with 95 in 1977, a decrease of 28%.

Principal Causes of Death

The ten leading causes of death in 1977 in New Jersey were 1) diseases of the heart, 2) malignant neoplasms, 3) cerebrovascular disease, 4) accidents, 5) influenza and pneumonia, 6) diabetes mellitus, 7) cirrhosis of the liver, 8) other diseases of the arteries, arterioles and capillaries, 9) certain causes of mortality in early infancy and 10) arteriosclerosis. The ranking remained unchanged from that of 1976. The mortality rates for heart disease, malignant neoplasms, accidents and other diseases of the circulatory system rose in 1977, while the remaining six leading causes of death resulted in fewer deaths per population.

Diseases of the heart rose from 27,613 deaths in 1976 to 27,721 in 1977. The slight increase was reflected in a rate increase from 375.3 to 377.2 deaths per 100,000 population. There were 440.4 deaths per 100,000 white males in 1977, little change from the 1976 rate of 440.3. The white female rate rose from 356.0 to 360.5 deaths per 100,000. A four percent decrease in deaths due to this disease classification among nonwhite males resulted in a rate of 250.9 compared to a 1976 rate of 261.3. By contrast nonwhite female deaths rose four percent, with a rate increase from 194.1 to 202.5 deaths per 100,000 nonwhite females. Diseases of the heart remained the leading cause of death of white males and nonwhite females aged forty-five and older, white females aged 65+, and nonwhite males aged 25 and older.

Malignant Neoplasms were the second leading cause of death in 1977 irrespective of race or sex. The crude mortality rates reported in 1977 were 228.9, 193.1, 183.5 and 123.9 per 100,000 white males, white females, nonwhite males and nonwhite females. All rates represented increases from 1976 reported rates, unadjusted for shifts in the age distribution of the population. Cancer was the second leading cause of deaths among white males over 44 years of age, and the third leading cause of death for white males aged 15-44. Among white females cancer was the leading cause of death of women aged 25-64, and the second leading cause of death of those aged 5-24, and those aged 65 and older. Cancer resulted in the second highest death toll among men and women aged 45 and older, and was the leading cause of female mortality in the age group 25-44. There were 2.3 percent more cancer deaths in 1977 than in 1976.

Although cerebrovascular disease remained the third leading cause of death among New Jersey residents, the mortality rate dropped for the fourth consecutive year. In 1973 there were 6,499 deaths compared to 6,351 in 1974, 5,831 in 1975, 5,504 in 1976 and 5,393 in 1977. The mortality rate has dropped from 88.2 in 1973 to 73.4 in 1977. Mortality rates remained higher in the white population, and among females compared to males. The white female rate in 1977 was 85.8, compared to the white male rate of 65.2, both rates representing decreases from the 1976 recorded rates. Rates among nonwhite increased slightly. The nonwhite female rate rose from 62.6 to 64.5 per 100,000 while the nonwhite male rate rose from 47.2 to 47.5 per 100,000. These increases might have been artificially produced, since the population estimates used in computing them were crude.

The number of accidental deaths rose from 2,520 in 1976 to 2,551 in 1977, resulting in a rate increase from 34.2 to 34.7 deaths per 100,000 population. More deaths were attributed to accidents than to any other cause group for persons between the ages of 1 and 24, irrespective of race or sex. Accidents were the leading cause of death among white males aged 25-44, and the second leading cause of death among white females and nonwhite males in this age group.

Influenza and pneumonia was the fourth leading cause of death among the elderly (aged 65+). In 1977 there were 144 fewer deaths in this disease category than in 1976. The result was a reduction of mortality from 24.8 to 22.9 deaths per 100,000 population.

There were 1,311 deaths due to diabetes mellitus in 1976 and 1,300 such deaths in 1977. Cirrhosis of the liver caused 1,248 deaths in 1977 compared with 1,267 deaths one year earlier. Other diseases of the arteries, arterioles and capillaries produced 865 deaths in 1977, an increase of five percent over the 824 deaths reported in 1976. The mortality rate rose from 11.2 to 11.8 deaths per 100,000 population. Nine percent fewer deaths due to certain causes of mortality in early infancy resulted in a reduction in the mortality rate from 10.9 to 9.9 per 100,000. There were 68 fewer deaths attributed to arteriosclerosis with a resulting reduction in the mortality rate from 9.7 to 8.8.

Other leading causes of death included suicide (643), bronchitis, asthma and emphysema (592), congenital anomalies (429) and homicide (414). Suicide deaths increased dramatically. In fact, the number of suicides were the highest in the last twenty-five years. The mortality rate of 8.7 was the highest since 1965. Bronchitis, asthma and emphysema deaths decreased 9.1 percent, producing a rate of 8.0. The homicide rate remained relatively constant with 9 more homicide deaths in 1977 than 1976.

Major Cardiovascular Diseases

In 1977 there were 34,792 deaths attributed to major cardiovascular diseases compared to 34,839 resident deaths in 1976, with the mortality rate remaining virtually unchanged (473.4 deaths per 100,000 population) over the two year period. Included in this general category are 1) Diseases of the Heart (27,721), 2) Hypertension (168), 3) Cerebrovascular Disease (5,393), 4) Arteriosclerosis (645), and 5) Other Diseases of the Arteries, Arterioles and Capillaries (865).

The mortality rate due to diseases of the heart has gradually decreased over the past twenty-five years, dropping from 433.7 deaths per 100,000 population in 1953 to a low of 372.5 in 1975. The rates in 1976 and 1977 (375.3 and 377.2 respectively) represented slight increases. However no adjustments have been made for the shift in the age distribution of the population. The rates cited are crude rates. Assuming the average age of New Jersey's population has increased, the decrease over the last twenty-five years in mortality due to heart disease would prove even more dramatic. Among white males and nonwhite females heart disease has been shown to be the leading cause of death in persons aged 45 and older. Among white females, diseases of the heart is the leading cause of death among the elderly and the second leading cause of death among those aged 45-64. Among nonwhite males diseases of the heart result in more deaths among those aged 25 and older than any other cause. Included among diseases of the heart are two prime causes of mortality 1) chronic ischemic heart diseases, and 2) acute myocardial infarction. In 1977 there were 13,919 deaths due to chronic ischemic heart disease (189.4 per 100,000 population) and 11,558 deaths attributed to acute myocardial infarction (157.3 per 100,000). Comparable figures for 1976 show 13,639 chronic ischemic heart disease deaths (185.4) and 11,859 acute myocardial infarction deaths (161.2). Other heart diseases included in this broad category are symptomatic heart disease (919 deaths), hypertensive heart disease (228 deaths), other heart diseases, specified as rheumatic (184), diseases of the mitral valve (176), diseases of the aortic valve (172), and all other diseases of the heart (565).

Hypertension deaths included malignant hypertension (23) essential benign hypertension (30 deaths), and hypertensive renal disease (115 deaths). In 1976, a total of 185 deaths were attributed to hypertension.

Cerebrovascular disease, the second large sub-category of major cardiovascular disease includes cerebral thrombosis (1,510 deaths in 1977), acute but ill-defined cerebrovascular disease (1,632 deaths), general ischemic cerebrovascular disease (987 deaths), cerebral hemorrhage (780 deaths), subarachnoid hemorrhage (304 deaths), and all other cerebrovascular diseases (180 deaths). In the last twenty five years the mortality rate has dropped from 99.7 to 73.4 deaths per 100,000 population. As recently as 1973 the rate was 88.2. Although rates among the white population have been shown to be somewhat higher than among the nonwhite population, nonwhite females aged 65 and older have the highest mortality among persons of that age group. The white male mortality rate for persons aged 65+ was 576.3 per 100,000, while the white female rate was 580.1 per 100,000. Nonwhite males aged 65+ recorded a rate of 522.5, while nonwhite females died at the rate of 728.7 per 100,000 as a result of this disease. The female population in general was more susceptible to death caused by cerebrovascular disease than the male population.

Almost 95 percent of arteriosclerosis deaths involved persons aged 65+. Rates in 1977 were higher among women, and in the white population. There were 222 white male deaths (7.1 per 100,000), 375 white female deaths (11.3 per 100,000), while only 21 nonwhite male and 27 nonwhite female deaths were recorded (4.8 and 5.5 deaths per 100,000 respectively).

Other diseases of the arteries, arterioles and capillaries include 1) aortic aneurysm (nonsyphilitic) (495 deaths), 2) arterial embolism and thrombosis (179 deaths), 3) gangrene (90 deaths), and 4) all other diseases (101 deaths). There were 667 deaths among the elderly and 169 deaths among persons aged 45-64. White males exhibited the highest mortality (16.5 per 100,000) of the four race-sex groups, while the white female rate was 9.0 per 100,000. Among nonwhite males there were only 29 such deaths (6.7 per 100,000), while only 24 deaths among nonwhite females (4.9 per 100,000) were reported.

Malignant Neoplasms

The second greatest cause of mortality in New Jersey, and throughout the United States is cancer. Over the past twenty-five years the crude mortality rate for New Jersey has steadily increased. An age adjustment of the mortality rate would serve to reduce the degree to which mortality has risen, but the fact remains that cancer deaths have risen dramatically. A recent report of the National Cancer Institute demonstrated that for the period, 1950-1969, New Jersey cancer mortality rates were among the highest in the country. Attempts to eliminate environmental factors associated with high cancer mortality may not impact upon the cancer mortality rates in New Jersey for several years due to the long latency period associated with many types of cancer. For the first time in New Jersey's history the number of deaths per 100,000 persons, attributed to malignant neoplasms has risen above 200 (203.1), with an increase of 2% in the number of reported cancer deaths in 1977. There were 6,922 white male deaths in 1976 compared to 7,114 in 1977, an increase of 2.7% giving rise to an increased rate of 228.9 per 100,000 persons. The white female rate rose from 190.9 to 193.1 as a result of a 1.1% increase in reported deaths. The nonwhite male mortality rate jumped from 174.1 to 183.5 deaths per 100,000 as deaths increased 5.3%. A 7.1% increase in nonwhite female deaths produced a 1977 rate of 123.9 compared to a 1976 rate of 115.6 per 100,000. There was virtually no change in the number of deaths of persons aged 25-44 (634 in 1976 compared to 628 in 1977). A 2.5% increase in deaths of persons aged 45-64, resulted in a mortality rate of 361.8 per 100,000 persons, while a similar increase in deaths among the elderly produced an age-specific rate of 1160.2 per 100,000 persons.

Cancer of the respiratory system resulted in 2,650 deaths among men and 881 deaths among women and disproportionate rates of 74.8 and 23.2 per 100,000 respectively. Cancer of the trachea, bronchus and lungs caused the deaths of 2,489 men and 838 women producing rates of 70.2 and 22.0 respectively.

Cancer of the digestive system and peritoneum resulted in 2,292 male deaths and 2,076 female deaths, with sex-specific rates of 64.7 and 54.6 respectively. Cancer of the large intestine accounted for 830 male and 945 female deaths (23.4 and 24.8 deaths per 100,000). Cancer of the pancreas produced 390 male and 394 female deaths (11.0 and 10.4 deaths per 100,000). Stomach cancer resulted in 414 male and 249 female deaths (11.7 and 6.5 deaths per 100,000).

Cancer of the genito-urinary organs caused the deaths of 1,227 men and 1,116 women in 1976. Among men, cancer of the prostate claimed 698 lives while cancer of the bladder resulted in 301 deaths. Among women, cancer of the ovary, fallopian tube and broad ligament claimed 463 lives, uterine cancer resulted in 238 deaths, cervical cancer claimed 178 lives, while bladder cancer resulted in another 126 deaths.

Breast cancer was the leading cause of cancer mortality among women as 1,520 such deaths were reported in 1977. In 1976, 1,419 breast cancer deaths were reported. The result was an increase in the mortality rate from 37.2 to 39.9 deaths per 100,000 women.

Accidents

Between 1973 and 1976 the number of accidental deaths was reduced by more than 15%, due almost entirely to a sharp decrease in motor vehicle accidents resulting from the lowering of speed limits within the state. Mortality due to accidents rose slightly in 1977 as 31 additional deaths were reported.

Fewer deaths were reported among persons aged 1-4, 5-14, and 25-44, while an increase was seen in the age group 15-24 and among the elderly. Accidents were the leading cause of death of persons under 25 years of age (excluding infants), but the highest age-specific mortality was reported among the elderly. In 1976, 609 persons aged 65+ died as a result of accidents, while in 1977 682 deaths were reported. The 10.3 percent increase in accidental deaths gave rise to a mortality rate of 88.9 per 100,000 persons aged 65+.

Accidental deaths were most prevalent among males than females, and highest among nonwhite males. Nonwhite mortality declined for nonwhite males under 45 years of age, and increased for all others. In particular, among nonwhite males aged 15-24, 28.9 percent fewer deaths were reported reducing the mortality rate from 96.1 to 68.4 per 100,000. Among white males in the same age category the mortality rate rose from 75.5 to 85.8. Thus, for this age group, white male mortality surpassed nonwhite male mortality. However, nonwhite male mortality remained twice as high as white male mortality for persons aged 5-14 and 25-44, and three times as high for those aged 45-64.

There were 1,079 motor vehicle traffic fatalities in 1977 compared to 1,042 in 1976 resulting in a rate of 14.7 in 1977 versus 14.2 in 1976. More than 37 percent of traffic fatalities involved persons aged 15-24 (402) producing an age-specific rate of 32.4 per 100,000 persons. Falls claimed the lives of 521 residents of whom 363 were 65 years of age or older. Accidental poisonings claimed the lives of 223 residents. Of this total 82 involved young people between the ages of 15 and 24, while 93 involved persons aged 25-44. Fire claimed the lives of 194 persons. The very young (under 5 years of age) and the elderly (aged 65+) were the most common victims of fire. Thirty-three children (6.5 per 100,000) and 48 elderly (6.3 per 100,000) died as a result of fire. The number of deaths caused by falls increased 7.4 percent between 1976 and 1977, while deaths due to fire increased 5.4 percent.

Influenza and Pneumonia

There were 1,638 resident deaths due to pneumonia and 35 additional deaths resulting from influenza in 1977. In 1976 there were 1,706 pneumonia and 118 influenza deaths. Twenty-eight of the 35 reported influenza deaths in 1977 were among elderly persons, while 1,198 persons aged 65+ died from pneumonia. There were no reported influenza deaths in the nonwhite population. A total of 796 white male deaths attributable to influenza and pneumonia produced a rate of 25.6. Among nonwhite males 122 pneumonia deaths resulted in a rate of 28.0. There were 687 white female deaths resulting from influenza/pneumonia producing a rate of 20.7. Among nonwhite females 68 pneumonia deaths produced a rate of 13.9.

Diabetes Mellitus

Since 1973 the number of deaths due to diabetes has decreased 15.3 percent, yet diabetes remains the sixth leading

cause of death in New Jersey. In 1977 there were 1300 resident deaths compared to 1311 in 1976. The mortality rate for 1977 (17.7) was unchanged from that of 1976. The mortality rates for men increased while female mortality rates decreased. Among white males an increase of 8.2 percent in reported deaths produced a rate of 15.7 per 100,000, while in 1976 the rate was 14.5. The nonwhite male rate rose from 13.7 to 15.1 per 100,000. There were 4.3% fewer white female deaths and 20.7% fewer nonwhite female deaths. The white female mortality rate dropped from 20.4 to 19.6 while the nonwhite female rate dropped from 24.7 to 19.6. Diabetes was the sixth leading cause of death of persons aged 45-64, and the fifth leading cause of death of those age 65+. There were 310 deaths among persons aged 45-64 in 1976 (18.4 per 100,000) compared with 299 deaths in 1977 (17.8 per 100,000). The number of deaths among the elderly increased from 949 (1,235 per 100,000) to 961 in 1977 (125.2 per 100,000).

Cirrhosis of the Liver

Despite a slight reduction in mortality in 1977, cirrhosis of the liver remains a significant cause of death with male mortality almost twice as great as female mortality and nonwhite mortality somewhat higher than mortality in the white population. There were 1,248 deaths in 1977 compared with 1267 one year earlier, resulting in a mortality rate of 17.0 per 100,000 persons. The white male mortality rate was 22.1 as compared to a white female mortality rate of 10.6. Nonwhite males died at the rate of 29.4 per 100,000 compared to 16.9 deaths per 100,000 nonwhite females. There were 41.2 deaths per 100,000 persons aged 45-64 and 45.6 deaths per 100,000 elderly persons. Striking differences occur when comparing mortality by age for white males versus nonwhite males. The nonwhite mortality rates are considerably higher in the younger population, while mortality in the white population is higher in the older age groups. There were 53 deaths among nonwhite males aged 25-44 compared to 78 white male deaths. The nonwhite rate for this age group was 47.9 compared to a white mortality rate of 10.0, almost a five fold difference. Among nonwhite males aged 45-64, 68 deaths were reported compared to 397 white male deaths. The nonwhite mortality rate of 102.9 was almost twice as high as that for the white population (53.8). Among persons aged 65+ there were 209 white male deaths compared to only 6 nonwhite male deaths. The result was a three-fold difference in rates (73.2 deaths per 100,000 white males compared to 28.5 deaths per 100,000 nonwhite male deaths). Nonwhite female mortality rates were 19.4 and 56.2 per 100,000 for the age groups 25-44 and 45-64, respectively, compared to white female rates of 4.6 and 23.1. The white female mortality rate of women aged 65+ was 29.5, slightly higher than the nonwhite rate of 26.7.

Bronchitis, Asthma and Emphysema

In 1977 there were 9.1 percent fewer deaths due to bronchitis, asthma and emphysema than were reported one year earlier. A total of 100 bronchitis deaths, 35 asthma deaths, and 447 emphysema deaths were recorded resulting in a composite rate of 8.0 per 100,000 persons. Mortality declined in each of the four race-sex groups. White male mortality declined from 13.6 to 12.2 deaths per 100,000, while white female mortality dropped from 5.4 to 5.3. There were eight fewer nonwhite male deaths and five fewer nonwhite female deaths producing rates of 6.2 and 2.2 respectively. Only sixteen deaths were recorded for the population under 45 years of age.

Suicide

There were 643 resident suicides in 1977, the largest number in New Jersey since 1940. The mortality rate rose to 8.7 per 100,000, equaling the 1965 mortality rate. Deaths

resulting from suicide were most frequent among the white male population, and among young and middle-aged nonwhite males. There were 82 white male deaths between the ages of 15 and 24, 137 between the ages 25-44, 126 between the ages of 45 and 64, and 81 aged 65+. Corresponding rates were 15.5, 17.3, 17.1 and 28.4 deaths per 100,000 population, respectively. Among the nonwhite male population there were 14 deaths amongst young men 15-24, 20 deaths among those aged 25-44, 7 deaths among those 45-64 years of age, and only one death in the 65+ age category, with corresponding rates of 16.2, 18.1, 10.6 and 4.7, respectively. By contrast, the highest age-specific rate for white females was 8.5 deaths per 100,000 women aged 45-64, while the highest rate among nonwhite women was 5.3 deaths per 100,000 women aged 15-24.

Homicide

Homicide remains one of the major problems in New Jersey, with 414 unnecessary deaths occurring in 1977, and 405 deaths reported in 1976. Although the figures for the past two years were considerably lower than those reported in 1973, 1974, and 1975, mortality rates among nonwhite males remain extremely high. There were 8 reported deaths of nonwhite males under 5 years of age (17.4 per 100,000) and 4 additional deaths between the ages of 5 and 14 (3.8 per 100,000). In 1977, 46 nonwhite males aged 15-24, 72 between the ages of 25 and 44, 27 between the ages of 45 and 64, and five aged 65 or older died as a result of homicide. Mortality rates were 53.3, 65.0, 40.9, and 23.7 per 100,000, respectively, for these four age groups. Mortality ranged from 2 to 10 times higher among nonwhite males than white males. The highest age-specific rate among white males was 8.0 deaths per 100,000 men aged 25-44. White female age-specific rates ran from 1.2 to 2.7 deaths per 100,000 population. Nonwhite female mortality rates were highest among those aged 15-24 (11.6) and 25-44 (13.7).

Morbidity

Morbidity data are collected and compiled for all reportable diseases in New Jersey. The Tuberculosis Services Program collects information on all tuberculosis cases occurring in New Jersey. Incidence data on syphilis and gonorrhea are collected by the Venereal Disease Control Program. Information on other diseases which are, by law, required to be reported, are collected by the Communicable Disease Program of the Division of Laboratories and Epidemiology. These diseases include amebiasis, aseptic meningitis, brucellosis, hepatitis, malaria, measles (rubeola), meningococcal infections, mumps, pertussis, rubella, salmonellosis, shigellosis, tetanus, trichinosis, tularemia, typhoid fever and typhus. Requests for detailed information regarding any of these disease conditions should be addressed to the above mentioned programs.

Information on more prevalent diseases, such as cancer and heart disease, is not now presently being collected. The newly formed cancer registry has neared completion of work plans for the collection of this vital information.

Tuberculosis

Since 1953, the number of newly reported cases of tuberculosis each year has been reduced by two-thirds, while the morbidity rate has been reduced by three-fourths. In 1953 there were 4,189 newly diagnosed cases of tuberculosis or 79.9 cases per 100,000 population. In 1977, 1,351 new cases of tuberculosis were diagnosed (18.4 per 100,000). The number of deaths attributed to tuberculosis annually has dropped from 693 in 1953 to 104 in 1977. The mortality rate has dropped from 13.2 to 1.4 deaths per 100,000 population.

The number of newly reported cases of tuberculosis among men exceeds the number reported among women irrespective of age. The tuberculosis morbidity rate is lowest

among persons aged 5-14, increasing with each subsequent age group. There were 39.5 newly diagnosed cases reported for every 100,000 persons aged 65 and older in the population. Among men aged 65+, 196 new cases were reported compared to 107 cases among women, resulting in morbidity rates of 63.9 and 23.2 respectively. Overall, 848 tuberculosis cases were reported in the male population compared to 503 cases among women. The male morbidity rate (23.9) was almost twice that of females (13.2).

In 1977 there were 1,162 clinically active cases of tuberculosis in the population. The active case rate was 15.8 per 100,000 persons, statewide. Highest active case rates were reported in Atlantic (27.4), Essex (31.4), Hudson (26.9), Passaic (19.7), and Mercer (19.2) counties. Among the larger cities in New Jersey, morbidity rates were highest in Atlantic City (72.2), Newark (60.4), Trenton (50.2), Hoboken (41.4), and Jersey City (41.4).

Venereal Disease

During the last twenty-five years the number of syphilis cases among residents of New Jersey has decreased dramatically, while the number of gonorrhea cases has continued to soar, reaching near epidemic proportions. In 1971 there were 6,029 reported cases of syphilis compared with only 2,636 cases in 1972. This amazing decrease was mostly a reflection of improved methods of tabulation which resulted in the elimination of duplicate counting of cases. Between 1972 and 1977 a more realistic decline of 28.0 percent was evidenced. The 1977 total of 1,899 cases produced a rate of 25.8 per 100,000 cases compared to the 1972 rate of 36.0. The number of primary and secondary cases dropped from 942 to 374, with a corresponding drop in the morbidity rate from 12.9 to 5.1 cases per 100,000. The number of diagnosed cases of early latent syphilis decreased 29.3 percent while the rate dropped from 8.3 to 5.9 per 100,000. These figures include civilian cases only. A total of 1,920 cases of syphilis were reported in 1977 including 386 primary and secondary cases, 434 early latent cases, 1,078 late and late latent cases, and 22 cases of congenital syphilis. By contrast, the number of civilian cases of gonorrhea has climbed from 3,682 cases in 1953 to 18,837 cases in 1977, a five-fold increase. The morbidity rate has almost quadrupled jumping from 70.3 to 256.3 cases per 100,000 population. Including the military 19,371 cases of gonorrhea were reported in 1977.

There were 1,082 male (30.5 per 100,000), and 838 female (22.0 per 100,000) cases of syphilis in 1977. Incidence of primary and secondary stage cases of syphilis was nearly three times higher among men (7.7 vs. 2.9), while incidence of early latent syphilis was nearly double (7.5 vs. 4.4). Highest incidence rates were reported among persons 20-24 years of age (62.2 per 100,000), and those aged 25-44 (43.7 per 100,000).

Incidence of gonorrhea was twice as great among men as compared to women (358.7 vs. 175.0 per 100,000). The highest incidence occurred among persons aged 20-24 (1256.2 per 100,000) where better than one out of every hundred persons in this age group contracted the disease. Among persons aged 15-19, 715.9 cases per 100,000 persons were reported, while better than one in every 333 persons aged 25-44 contracted this disease.

Hepatitis

The number of reported cases of infectious hepatitis (A), serum hepatitis (B), and hepatitis (unspecified), declined in 1977. There were 844 cases of infectious hepatitis in 1977 compared with 937 cases in 1976. The incidence rate dropped from 12.7 to 11.5 over the one year period. Serum hepatitis cases declined from 859 (11.6 per 100,000) to 809 (11.0 per 100,000). Thirty-five percent fewer cases of hepatitis (unspecified) were reported, while the incidence rate dropped

from 6.1 to 4.0 cases per 100,000 population. Hepatitis incidence was higher for men than women. There were 14.0 cases of infectious hepatitis per 100,000 men compared with 9.1 cases for every 100,000 women. The male rate for serum hepatitis was 13.9 compared to a female rate of 8.3. A total of 170 cases of hepatitis (unspecified) were reported among men (4.8 per 100,000) compared with 121 female cases (3.2 per 100,000). In general, hepatitis cases increased to age 24, and decreased thereafter. The highest incidence of hepatitis was reported among persons aged 20-24. The infectious hepatitis rate was 34.9 per 100,000, the serum hepatitis rate was 43.7, and the hepatitis (unspecified) rate was 11.4 per 100,000 persons in this age group.

Other Notifiable Diseases

Occurrence of certain diseases are required by law, to be reported to the State Health Department. These diseases include mumps, measles (rubeola), rubella (German Measles), typhoid fever, malaria, aseptic meningitis, and a host of other diseases, usually of the contagious variety. In 1977 reports for some of these disease conditions showed marked declines, while for others, dramatic increases were observed.

The number of cases of measles (rubeola) dropped from 690 in 1976 to 210 in 1977, a decrease of 69.6 percent. The number of cases of measles fluctuates enormously from year to year. In 1975, 477 cases were reported, while in 1974 there were 5,693 cases. The number of cases of rubella (German Measles) rose by 19.7 percent with 1,775 cases in 1977 compared to 1,483 in 1976. Only 1,021 cases were reported in 1975, and only 465 in 1974. Salmonellosis cases (excluding typhoid fever) rose from 1,211 in 1976 to 1,817 in 1977. In 1975, 1,118 cases were noted. There were only 186 cases of shigellosis (bacillary dysentery) in 1976, compared with 722 cases in 1977, almost a four-fold increase. In 1975, 255 cases were reported. The number of cases of mumps decreased 36.2 percent with 385 cases in 1977 compared to 603 in 1976. In 1975 there were 465 cases, while in 1974, 784 cases were reported, again showing dramatic year to year fluctuation. The number of cases of aseptic meningitis rose slightly in 1977 with 208 reported cases compared to 197 in 1976, 345 in 1975, and 151 in 1974. There were 51 cases of trichinosis in 1977, and only 7 in 1976. Other diseases reported include amebiasis (64 cases), brucellosis (5), malaria (19), meningococcal infections (52), pertussis (2), tetanus (3), typhoid fever (22) and typhus fever (Rocky Mountain Spotted Fever) (11).

Of the 210 measles cases, 72 occurred in Cumberland County, and 46 occurred in Monmouth County. There were 203 cases of mumps in Middlesex County, 54 in Camden County, and 41 in Essex County, accounting for 77.4 percent of all cases. Middlesex County also reported a major proportion of rubella cases (35.3% of all cases), with other large outbreaks noted in Monmouth (387 cases) and Burlington (189 cases) counties. Most shigellosis cases occurred in three counties, Essex (172 cases), Mercer (131), and Middlesex (117). Thirty-nine of the 64 cases of amebiasis reported in 1977 occurred in Cumberland County.

**TABLE 1: POPULATION ESTIMATES, RESIDENT BIRTHS, MARRIAGES AND RESIDENT DEATHS
NUMBERS AND RATES PER 1,000 POPULATION, NEW JERSEY: 1953 - 1977**

| 1960 | 5,265 | 86.7 | 665 | 11.0 | 752 | 12.4 | 4,776 | 78.7 |
| 1961 | 5,170 | 83.1 | 864 | 13.9 | 721 | 11.6 | 4,302 | 69.1 |
| 1962 | 6,291 | 98.7 | 1,191 | 18.7 | 864 | 13.6 | 3,557 | 55.8 |
| 1963 | 5,613 | 86.3 | 1,177 | 18.1 | 756 | 11.6 | 3,968 | 61.0 |
| 1964 | 4,958 | 75.0 | 1,140 | 17.2 | 930 | 14.1 | 3,744 | 56.6 |
| 1965 | 4,927 | 73.3 | 944 | 14.0 | 798 | 11.9 | 3,938 | 58.6 |
| 1966 | 3,731 | 54.7 | 704 | 10.3 | 522 | 7.7 | 4,327 | 63.4 |
| 1967 | 3,829 | 55.4 | 600 | 8.7 | 408 | 5.9 | 6,173 | 89.2 |
| 1968 | 2,935 | 41.9 | 457 | 6.5 | 291 | 4.1 | 8,098 | 115.5 |
| 1969 | 4,111 | 57.9 | 622 | 8.8 | 444 | 6.2 | 8,410 | 118.4 |
| 1970 | 5,078 | 70.6 | 891 | 12.4 | 568 | 7.9 | 9,751 | 135.6 |
| 1971 | 6,029 | 83.0 | 945 | 13.0 | 605 | 8.3 | 11,480 | 158.1 |
| 1972 | 2,636 | 36.0 | 942 | 12.9 | 608 | 8.3 | 16,658 | 227.5 |
| 1973 | 2,895 | 39.3 | 1,009 | 13.7 | 678 | 9.2 | 16,206 | 219.9 |
| 1974 | 2,634 | 35.6 | 836 | 11.3 | 622 | 8.4 | 15,294 | 206.8 |
| 1975 | 2,410 | 32.8 | 758 | 10.3 | 661 | 9.0 | 17,261 | 234.9 |
| 1976 | 2,180 | 29.6 | 556 | 7.6 | 587 | 8.0 | 17,708 | 240.7 |
| 1977 | 1,899 | 25.8 | 374 | 5.1 | 430 | 5.9 | 18,837 | 256.3 |

Note: The sharp decrease in new cases of syphilis in 1972 reflects improved tabulation of data eliminating cases previously recorded in New Jersey or other states.

| 2. Malignant Neoplasms | 5 | 4.8 | 5 | 4.8 |
| 3. Influenza and Pneumonia | 3 | 2.9 | 1 | 1.0 |
| 4. Congenital Anomalies | 3 | 2.9 | 3 | 2.9 |
| 5. All Other Causes | 8 | 7.7 | 10 | 9.6 |

15-24

| | | | | |
|---------------------------|----|------|----|------|
| TOTAL DEATHS | 77 | 81.0 | 77 | 80.9 |
| 1. Accidents | 21 | 22.1 | 18 | 18.9 |
| 2. Homicide | 11 | 11.5 | 17 | 17.9 |
| 3. Diseases of the Heart | 6 | 6.3 | 2 | 2.1 |
| 4. Cirrhosis of the Liver | 5 | 5.3 | | |
| 5. Suicide | 5 | 5.3 | 4 | 4.2 |
| All Other Causes | 29 | 30.5 | 36 | 37.8 |

* Rates were not computed due to lack of appropriate population estimates.

TABLE 19D: FIVE LEADING CAUSES OF RESIDENT DEATHS BY AGE
1976 - 1977 NONWHITE FEMALES (Continued)

| CAUSE GROUP | 1977 | | 1976 | |
|-------------|------------------|------------------|------------------|------------------|
| | NUMBER OF DEATHS | RATE PER 100,000 | NUMBER OF DEATHS | RATE PER 100,000 |

25-44

| | | | | |
|---------------------------|-----|-------|-----|-------|
| TOTAL DEATHS | 288 | 207.0 | 331 | 237.6 |
| 1. Malignant Neoplasms | 56 | 40.2 | 57 | 40.9 |
| 2. Diseases of the Heart | 40 | 28.7 | 42 | 30.2 |
| 3. Cirrhosis of the Liver | 27 | 19.4 | 39 | 28.0 |
| 4. Accidents | 24 | 17.3 | 34 | 24.4 |
| 5. Homicide | 19 | 13.7 | 16 | 11.5 |
| All Other Causes | 122 | 87.7 | 143 | 102.6 |

45-64

| | | | | |
|----------------------------|-----|---------|-----|---------|
| TOTAL DEATHS | 878 | 1,147.4 | 840 | 1,096.3 |
| 1. Diseases of the Heart | 292 | 381.6 | 269 | 351.1 |
| 2. Malignant Neoplasms | 262 | 342.4 | 235 | 306.7 |
| 3. Cerebrovascular Disease | 79 | 103.2 | 81 | 105.7 |
| 4. Cirrhosis of the Liver | 43 | 56.2 | 37 | 48.3 |
| 5. Diabetes Mellitus | 26 | 34.0 | 42 | 54.8 |
| All Other Causes | 176 | 230.0 | 176 | 229.7 |

65+

| | | | | |
|----------------------------|-------|---------|-------|---------|
| TOTAL DEATHS | 1,453 | 4,856.9 | 1,408 | 4,700.5 |
| 1. Diseases of the Heart | 653 | 2,182.8 | 638 | 2,129.9 |
| 2. Malignant Neoplasms | 280 | 935.9 | 262 | 874.7 |
| 3. Cerebrovascular Disease | 218 | 728.7 | 203 | 677.7 |
| 4. Diabetes Mellitus | 61 | 203.9 | 67 | 223.7 |
| 5. Influenza and Pneumonia | 32 | 107.0 | 27 | 90.1 |
| All Other Causes | 209 | 698.6 | 211 | 704.4 |

TABLE 20: RESIDENT DEATHS DUE TO DISEASES OF THE CIRCULATORY SYSTEM BY AGE AND SEX; NUMBERS, AGE-SPECIFIC RATES, SEX-SPECIFIC RATES PER 100,000 ESTIMATED POPULATION: 1977

TABLE 20: RESIDENT DEATHS DUE TO DISEASES OF THE CIRCULATORY SYSTEM BY AGE AND SEX; NUMBERS, AGE-SPECIFIC RATES, SEX-SPECIFIC RATES PER 100,000 ESTIMATED POPULATION: 1977

| AGE AND SEX | TOTAL (390-458) | | Active Rheumatic Fever (390-392) | | Chronic Rheumatic Heart (393-398) | | Hypertensive Disease (400-406) | | Ischemic Heart (410-414) | | Other Diseases of Heart (420-429) | | Cerebrovascular Disease (430-438) | | Other Diseases of Arteries, etc. (440-448) | | Diseases of Veins & Lymphatics & Other Dis. of Circulatory System (450-458) | | |

APPENDIX A

Glossary of Terms

AGE-SPECIFIC MORTALITY RATE - the number of deaths of persons of a given age group per 100,000 estimated persons in that age group usually expressed as an annual rate.

CAUSE GROUP - a summary of deaths resulting from, or cases of, related diseases as defined by the International Classification of Diseases Adapted For Use in the United States, published by the U. S. Department of Health, Education, and Welfare; usually specified by a series of 3-digit codes i.e. 140-209 - malignant neoplasms.

CAUSE-3 DIGIT - the cause of death or morbidity as defined by a 3-digit code in the International List. Disease conditions are also further classified and so specified, by the addition of a decimal point and a fourth digit. For example, the three digit code "140" refers to a malignant neoplasm of the lip, and the four digit code "140.1" refers to a malignant neoplasm of the lower lip.

ESTIMATED POPULATION - the estimated number of persons in a given group based on the latest census data and adjusted for annual births, annual deaths and net migration.

FETAL DEATH - a death prior to complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy also known as a stillbirth. The death of an infant that has breathed or shown other evidence of life, no matter for how short a period, should be reported as a live birth and an infant death.

FETAL DEATH RATES - the number of fetal deaths occurring in the twentieth week of gestation or later (required by law to be registered as fetal deaths) per 1,000 live births, usually expressed as an annual rate.

FERTILITY RATE - the number of live births to women aged 15-44 per 1,000 women in this age group, usually expressed as an annual rate.

ILLEGITIMATE BIRTH - a birth to an unwed mother, or to a mother whose husband did not father the infant.

ILLEGITIMATE FETAL DEATH - a fetal death occurring to an unwed mother, or a mother whose husband did not father the fetus.

INFANT DEATH - the death of a baby under one year of age, no matter how short a period a time the baby breathed or shown other evidence of life.

INFANT MORTALITY RATE - the number of infant deaths per 1,000 live births, usually expressed as an annual rate.

INTERNATIONAL LIST - a listing of disease classifications known as the "Eighth Revision International Classification of Diseases Adapted For Use in the United States", published by the United States Department of Health, Education, and Welfare, used in the statistical coding and tabulation of specific disease morbidity and mortality.

LEGITIMATE BIRTH - a birth to a married woman whose husband fathered the infant.

LEGITIMATE FETAL DEATH - a fetal death occurring to a married woman whose husband fathered the fetus.

MATERNAL DEATH - a death of a woman occurring during the period of pregnancy or following delivery of the infant and related to the pregnancy or delivery of the infant.

MATERNAL MORTALITY RATE - the number of maternal deaths per 10,000 live births, usually expressed as an annual rate.

MORBIDITY - the relative incidence (number of cases) of disease, usually used with respect to specific disease conditions i.e. tuberculosis morbidity refers to the number of cases of tuberculosis.

MORTALITY - the number of deaths.

NEONATAL - of, relating to, or affecting the newborn and especially the human infant during the first month of life.

NEONATAL MORTALITY RATE - as used in this text, the number of deaths of infants under 28 days of age per 1,000 live births, per year.

NET MIGRATION - the difference in population resulting from persons attaining residency status, and persons dropping residency status, often referred to as in-migration and out-migration, respectively.

PERINATAL - of, relating to, or affecting the fetus and the newborn, especially the human infant during the first month of life.

PERINATAL MORTALITY RATE - the number of deaths of infants less than 28 days of age, and registered fetal deaths per 1,000 live births plus registered fetal deaths.

RACE-SPECIFIC MORTALITY RATE - the number of deaths in a given ethnic group per 100,000 estimated population in that ethnic group.

SELECTED PLACES - as used in this report, cities, townships and municipalities with a population of 45,000 or more as of the 1970 census.

SEX-SPECIFIC MORTALITY RATE - the number of deaths of males/females per 100,000 estimated males/females in the population.
